The people that claim that ConNect is the best thing since sliced bread
have obviously never ever tried Flash...

I need a full screen window not 2/3, Flash gives me a full screen window with a
8 * 8 Font..

There are no fonts to work with ConNect and give 80 * 24 lines at medium res,
the window of ConNect is far to small and cluttered..

Trapido is the Only German comms program that comes any were near Flash..

>otherwise the same? Specifically what I want to do is add an additional
>MIDI out port to my Cubase set-up... can I just buy a 9-25 pin RS-232 converter
>and plug in something like MODEMMIDI that usually plugs into the ST serial
>port?

Hm, lessee if I can remember what's there... The port is not only physically different, it is logically different. The standard ST port (that all STs, STEs. and TTs have) is connected to an MC68901 MFP. The Falcon's serial port is connected to port A of the Zilog 8530 SCC. (I wish I knew why this was done; in both the TT and Mega STe you get both the MFP serial port *and* the SCC serial ports. On the Falcon, there is no MFP serial port. Sigh...)

9 pins. hmm... RXD, TXD, RTS, CTS, DTR, DSR, DCD, RI, GND. I think that's it. Btw, the pinout is the same as the IBM AT 9-pin serial pinout.

Software that only uses BIOS and XBIOS functions to control the serial port should work unmodified, since the XBIOS emulates some of the 68901 status bits for the 8530 ports, but if you try to tweak 68901 registers directly, no results will be seen... (The 68901 is still there, it just doesn't have anything connected to its serial port.)

Does anyone know/have the latest versions of the software for the Discovery Cartridge? I bought one about 3 or 4 years ago, and the software was 2.6. A friend found 2.6a for me, but it wasn't much of an upgrade. What I want to know is if Happy Computers are still alive, and can I get/will someone tell me where I can get the software for the cartridge!?

Help Please!

Karl.

Well, from what I saw, this wasn't the only mistake. Under IPC, they
just had "Clipboard" for MTOS (named pipes, anyone?), No multiple
resolutions (I have 6 on my TT) except for 3rd party add-ons, and a very
short list of output devices (Epson, IBM, Atari, VGA). Hopefully these
were their mistakes and not Graham's (if they were, I'll have to give
him a really bad time :-)). Either way, a correction is in order.

Nit:

The ST was a price/performance breakthrough, but it wasn't "twice as
powerful as anything else on the market." Macs were using the same
8Mhz 68000, and Amiga prototypes (with the same CPU and better
graphics) were already out and about.

Well, here is an interim measure. If you have a wordprocessor that can load
RFT Format, you can tell her to save that instead of WP 5.1 or 4.2.

If you can't do that, there is a program that will convert RFT to
WordWriter/1st word which almost any program will import. I forget the names
of the utilities, but I know they exist. You will lose some information like
fonts and such, but you'll retain common attributes like italics, margins,
bold, etc.

Roger,

I think I agree with you about ConNect...not too god for Med.res (what I use)...The window is too small and the font, though workable, isn't very nice. I bet another reason some might go "ape" over ConNect is that they have a mono monitor and can take _full_ advantage of ConNect.

It does seem like it has a lot of nice things about it. (Excluding the price differnce between it ans Uniterm -- my favorite!)

Hi all. I've just been informed by GST software by e-mail, that
the Patch Disk to update UK versions of NeoDesk is effectively
shareware/freeware whatever, and the 4.95 fee is only for handling.
Hence, they have no problems with anyone uploading the patch disk
to an ftp site, or posting to comp.binaries.atari.st or whatever.
Also, it's available by modem on their BBS - 0480 492 025.
I don't have a modem, but if some nice person who does, and
wants the upgrade, could later archive it up and post / upload
it somewhere, I'm sure a lot of us would be grateful. Cheers...

I wondering if someone could help me with a little problem I got.
My girlfriend uses a PC to write reports at school, but would like to
sit at home to work on them in the evening. The problem is that she
is using Word Perfect for her reports and I cant load them into any of
the wordprocessing programs I got at home.

My question is this: Does there exist a program on the ST which reads
and writes Word Perfect files(v5.1 I think)? Or a program which can
convert WP files to a common ST format?

I really hope that it does, because she is threathening me to buy a PC(cant
understand why, really) :)

WP for Atari can do PC-WP 4.1 files, I remember. If 5.1 can export files in
4.1 format (I also remember it can do) then there is no problem. Get
yourself a WP for Atari. Export your PC-WP files to Atari formatted 3.5" DD
floppy and import them to your own Atari and vice versa. That's all.

There's a utility by Robert Best that converts between WP5 and First Word Plus (not graphics). Email him on mbdqbest@diamond.sara.nl (costs about $20 I think - pretty steep).

If WP5 takes Rich Text Format (RTF) there's a small utility on atari.archive called 1wp2rtf.zoo to convert at least _from_ Wordplus to RTF.

Finally there's Redacteur3, a wordprocessor that reads/writes Word Perfect files. Prices range from ₣39 (junior version) to ₣99 (full version) (about US$60 - 150). Not a cheap option, but its supposed to be a very good WP, and not as much as a new PC :-)

Sam

> do work at home with those same MS-DOS programs (eg 1-2-3, etc.).

For some of these programs, such as Lotus, there do exist ST versions or clones of those programs. Of course, using the MSDOS versions lets the users get used to those, which they will probably hit in the majority of jobs, etc.

>- The user can't live without some of the programs (games, etc.) that
> (for some reason, ummm, larger market?) won't get released on the
> Falcon platform.

Never hurts to expand your software base. That's one of the niceties of emulation. When you do get an IBM/MAC/whatever software that runs under the emulation, it might be helpful to note so on the registration card that you send in - let them know what actual platform their software is really being run on.

>- The user just plain likes little gadgets just so they can say `My
> computer will out emulate your computer'.

Or more general: users that simply like gadgets (this coming from someone who has his MSte, 286, TV, monitor, cassette desk, VCR, and boom box all interconnected in one way or the other :-)

And finally, one of the best answers to a "why" question:
"because we can" (said in the voice of the one Heather from "Heathers" :-)

>With the ability of Falcon to read/write MS-DOS compatible disks, and
>the possibility of Falcon being able to do close to `real' thing's

6218. Ghostscript and ATM

Newsgroup: comp.sys.atari.st
Date: 1993-04-29 12:28:23 UTC
From: y0000028@ws.rz.tu-bs.de
Message-ID: <1993Apr29.122823.8489@ibr.cs.tu-bs.de>
Source record: 206794

Help!

I copied some pfb files used with ATM to my Ghostscript
font folder and installed the fonts in fontmap, but i can't
use them.

Every time i'm going to find a font i get a loading message
and than an /undefined in ... error, where ... is something
barely readable.

To use the fonts i removed some character before the %!PS,
but i changed nothing else.

The ATM (Adobe Type Manager?) is supposed to be a simple
Type 1 font rasterizer, I believe. How does he cope with these
fonts?

BTW, the fonts came as an archive which unpacked without error.

Many thanks in advance

Axel Kielhorn

6221. ASTRAsoft DeskTracker MT release

Newsgroup: comp.sys.atari.st
Date: 1993-04-29 12:40:54 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1993Apr29.134054@cs.bham.ac.uk>
Source record: 206796

Hi!

If you get this down from atari.archive or clauthal, then you'll probably notice that there's a bug in it. Yup, it's admission time!

The DeskTracker accessory sometimes doesn't appear on the menu bar until you run another program. We're quickly working on it and we'll send the FTP sites another version in the next few days.

Other than that it doesn't work under a memory-protecting version of MiNT. If anyone's got an idea why a Lattice C5 PROGRAM should come up with a Stack overflow error under MiNT, then PLEASE let me know because I don't have an 030 myself so it's difficult to find solutions.

Thanks for your patience and please do send comments and ideas to me!

David.

>e-mail : am@materna.de

These files are created and depacked using magic shadow archiver.
This should be in Archivers as shadow.??? or newmsa.???

Forget it if you can't get a BIG ramdisk or have 2 drives or hard drive; it
uses a LOT of disk swapping!!

Martin

>
> There are no fonts to work with ConNect and give 80 * 24 lines at medium res,
> the window of ConNect is far to small and cluttered..

Look, it's a different design philosophy. Connect decides to use GEM and
windows. That's one way to go, and has certain advantages. A disadvantage is
that you'll NEVER get a full screen window with an 8x8 font. Can't be done in
med res. You're railing against limitations of your system, and pegging
Connect as the culprit. This is wrong.

About cluttered windows, Connect is by far the most flexible GEM program I've
ever seen. The only thing that you must live with is the info bar and the
move bar. All the rest of the gadgets can be turned off, allowing for more
window real-estate. It seems to me that the author did everything he possibly
could to get Connect to work on lower-res screens. I appreciate that.

If you can't use it, fine. Use something else.

>
> Trapido is the Only German comms program that comes any were near Flash..

I like Trapido. It is, at least in the version (1.10?) I used, incredibly buggy.
It uses a different philosophy for display. It isn't "better" than Connect.

MSA files are from the Magic Shadow Archiver, that extracts a whole disk saving it as a single file, using RLE encoded. To get the original disk back you need msa141 from atari.archive in the Archivers directory.

6228. ST monitor for sale

Newsgroup: comp.sys.atari.st
Date: 1993-04-29 15:16:28 UTC
From: porterb@acf4.nyu.edu
Message-ID: <1rorgc$q04@calvin.NYU.EDU>
Source record: 206458

Bought this monitor only to discover that the 1040ST was broken and not worth fixing. It is sitting in its box waiting to be shipped to someone who will pay a few bucks (I bought it for $170 + tax -- don't know what anyone will find it worth)... eager for the room in my small apartment.

I sent out the previous paragraph a couple of months ago and there was more interest in the broken computer than the new monitor. Sorry - I did throw the computer out. The answer to the other question asked is monochrome. I am eager to get rid of this -- hope someone can use it.

Please reply to:

porter@cs.nyu.edu

>not have used an A1200 or turned one on?

I assume you've used a Falcon then, to be making the same judgement. And BTW,
I'm NOT choosing an ST, it's a Falcon030. The ST's are 68k based machines
w/o a Multitasking O/S. The Falcon is 68030 base w/ Multitasking.

Big difference.

Not, of course, that you'd understand.

> graphics engine.

Hi Jon,

No offense, but how long have you been involved with Atari products?
Anyone who has followed the bumbling Atari saga over the years knows
that foresight and planning are not in the Atari vocabulary. The
machine will certainly not be upgradable since the usual Atari upgrade
path involves one easy step...buy their latest box. No thanx. I
just upgraded one of my 486-33 boxes by taking out the SOCKETED 33mhz
cpu and replacing it with a 486DX2-66. After selling my old chip,
the net cost of this upgrade was about $300 for a roughly 70% increase
in performance (I don't do much disk intensive work and I have a lot
of RAM in that box).

The person who has probably single-handedly kept Atari out of Chapter 11
is David Small. His sense of business ethics, as well as an array of
well supported upgrades for Atari computers is what keeps the "faithful"
going.

Cheers,

Chris

>please check if it might still be possible to fit both.

There is room for a 2,5" hard drive, of course. That's exactly what ATARI puts in there if you order a 4/65 Falcon.

_If_ the ZIP RAM extension replaces the original RAM card, there won't be a space problem. The extension locations are:

68882 - socket under the mains transformer

processor direct slot (286 emulators, graphics cards) - left side, just below the transformer

RAM slot - in the center of the machine

ROM socket - _under_ the RAM board

Hard drive - inbetween transformer and floppy drive, mounted on a metal rack.

Questions?

have fun - Peter

How do Atari dealers survive without CPU's to sell for most of the time. I bet they are Amiga dealers too and are moonliting as Atari dealers. Atari dealers can't survive without the Amiga...

```
Hi Gregory,

G>I have the following GFA Basic code as part of a program to track
G>lottery numbers:
G>
G> totalcount=16
G> DIM mstrip$(totalcount+1)
G> RESTORE strip_data
G> FOR i%=1 TO totalcount+1
G> READ mstrip$(i%)
G> NEXT i%
G> strip_data:
G> DATA Desk , Lotto 6/49 Tracker ,------------------,1,2,3,4,5,6,""
G> DATA Numbers , Get occurences , Enter lotto numbers , Check lotto
numbers , Exit ,""
G> DATA "",""
G>
G>Now, here's my dilemna. It works fine when being run in the GFA Basic
G>editor, but when it is compiled, it gives me an address error (3 bombs).
G>I don't understand why it would give me that error. I have an OPTION
G>BASE 1 statement in my INIT module (if that helps). Any help would be
G>greatly appreciated, as I am nearly to the end of my rope with this bug.

The compiler works fine, but the Interpreter is to smart to punish you. :-)

OPTION BASE 1 does _not_ mean, that the numbers of cells in the array
are the same like OPTION BASE 0

OPTION BASE 1 only saves memory by not initializing the cell '0'.

I.e.: If you type

OPTION BASE 0
DIM A%(1)

then the field has two cells (#0 and #1)

If you type

OPTION BASE 1
DIM A%(1)

then the field has one cell (#1)

So you can remember:

DIM sets the _highest_ cell number!
```

Good luck!

Gerhard (LogiLex, Germany)

> bugs?

There's only one problem... The Emulation may be 100% ANSI standard compatible,
but it's not at all compatible to what's commonly used in BBS's...

(That's why several terminalprograms have a special emulation called
"ANSI-BBS", wich is basically the same as the codes supported by PC-DOS's
ANSI.SYS device driver, as far as I know...)

I'm quite missing that, as I'm calling more private BBS systems than places
where I need a "real" ANSI emulation...

6261. Re: UNIX to Atari ST (via DOS???)

Newsgroup: comp.sys.atari.st
Date: 1993-04-30 09:02:26 UTC
From: censjg@clust.hw.ac.uk
Message-ID: <1993Apr30.090226.18563@cee.hw.ac.uk>
Source record: 206485
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

If I remember correctly, mstools is a fairly old ms-dos compatibility package, I believe it has some problems of it's own. I would suggest getting and installing mtools, a freeware ms-dos program suite for Unix machines, it compiles no problems on Sun/DEC and many other hosts and has been working well here for months.

I 'm not sure I've actually used it to write disks I subsequently read on an ST, but I've had no problems reading, writing & formatting ms-dos disks that are usable in a Unix box or a PC equally easily. Also, I have never had any problems reading PC 720K disks in my ST, so I think mtools could solve your problems.

It's available from loads of archive sites, eg gatekeeper.dec.com in the states and src.doc.ic.ac.uk in the Uk (check with archie to be sure).

Hope this helps,

Simon

The Ajax does nothing different than the 1772, so there is no automatic
step-adjust. You have to add a MMV with just a bit less than 3ms
pulswidth which is triggered by the STEP signal from the FDC. Then, when
the MMV is active, you have to supply 8MHz to the FDC.

Don't use that for own expansions, unless you absolutely need a phase-
synchronous 16MHz clock. That signal is very weak and can cause trouble
if it has to drive an additional load.

For HD Floppy support, it is best to use an integrated 16MHz quarz
oszillator - these are cheap and provide a good quality signal.

I believe there is a memory allocation bug in the latest version
of the GFA compiler. I can think of one person at least (Hi Andre 8-)
who is desperately waiting for a bug for this, as he gets a fair
number of complaints about his program crashin, and its not his fault.

BE CAREFULL WITH MSA_II, it is much faster then magic shadow archiver BUT it
has troubles with some disk formats (can't remember off hand,) There is
also reports of someone who tried to use it as an accessory and it wiped his
hard drive. Once the disk recognition problem is fixed the new msa-ii will
be the only one to use. It is HUGELY faster.

Can anyone tell me how I configure the ST's serial port from C or assembler? I need to be able to set baud rate, word format, parity etc, and perhaps the size of the buffer associated with the port, though this is of less importance.

Before you ask, I'm just writing a MIDI <-> serial converter so I can plug it into a Sun and dump/load/process midi data from there.

email preferred, thanks

Simon

>Unless you use overscan (hardware or software 'emulators')

Just to test things out, I booted in ST Low res with MonSTEr,
and effectively got a 640x400x16 scrolling screen (it was nice
to see 16 color ANSI, even with the scrolling). Should be cool
on a Falcon (as well as a TT)...

>The biggest problem I have with Connect is that it does use GEM windows
>which makes screen updating quite sluggish!
>(Stick Warp-9 on and it improves, but still not as fast as say a plain
>full-screen terminal, GEM trying to keep up with 19.2K text
>on the screen is laughable!)

Do you have it set to smooth scroll or jump scroll? Smooth scroll
may be a bit slow for 19.2k, but jump scroll (though jumpy?) seems
to keep up with it (I have Warp9 3.60 installed, BTW)...

Have you gone to the "Language" option and changed the language
from "ATARI" to "VTxxx"? If you do this, you'll see the normal
ANSI character set. Hope this helps you...

>BTW, what is a "window GEM window" anyway?

It definatly depends on the computer you are using. With a GEM-based
terms programm on a 1040 ST without NVDI or Warp9 redraw really is
a pain. NVDI helps a lot.
Using CoNnect on my TT with NVDI I even can display at a 57600 baud
line without remarkable delay, which is much faster than 'real'
terminals like a Falco...

It'll work. - provided that you can break the composite video
into separate RGB and H/V sync. There are IC's available to do the
job.

BTW: the atari monitor is analogue RGB. CGA monitors use TTL levels.

Atari ST for sale:
* 1040ST with SM124 Monochrome monitor (b&w)
* PC Ditto (IBM emulator - software)
* Magic Sac+ and Translator One (old Mac emulator - hardware)
* Final Cut (Midi Software)
* 1st-Word, DB Master, etc. etc.

I am taking the best offer(s). I had a few people interested and a few deals arranged, but they must have been busy with exams because I haven't heard from them since. I am willing to break up the package, but the monitor sticks with the computer unless I sell the computer separately first. For those who have asked if I was willing to break up the system for the separate parts, if you're still interested, please email me.

The system is in Mint condition as the only purpose I have for it now is as a terminal emulator.

How is the Falcon030 doing in Europe?

The reason I ask is that Atari is supposely making around 50,000 of these systems each month. And since none are in the U.S. besides developers and dealer units, I'm wondering where they are all going?

There has to be around 250,000 out there so far.

How are they doing NEAR you? Dealers?

Wow. Is Townsend a recent casualty? Or did he split a while ago? You know,
one impressive thing about Atari these days is how Brodie and Rehbock hang
in there, keeping their chins up while the whole company crashes down
around them. Rehbock even sounds *optimistic* about their future - don't
know how he does it. :)

Well, in France, everything is sold out as soon as they arrive at the
dealers. But, it's now difficult to say, because all 'National HQ' have been
completely re-organized and stock has been moved to Holland.
But, you can assume that every Falcon arrived in Europe is already reserved.

Atari Delaer without CPU's? Excuse me, but as an _Amiga_ dealer (yup, I sell
Amigas but buy Atari ;)), I had one hell of a time getting 1200's and
4000's in stock. Not to mention the fact that he had to send a 4000 back
because it's display was wasted (kept showing a green tinge on everything.)
Lost a sale because of that. It took us six weeks to get 1200's in, and
when they did they were the shitty (pardon the language, but it's true) 1200HD
models. What were they that bad? They came with 45 megs SEAGATES!!! Aggg!
All Commodore HD models w/ IDE come w/ Seagates! For _less_ money we wanted
the 1200 w/o HD and put 85 megs Maxtors in them. The best drive for less
money, hmmm. So, it took six weeks from sending those 1200HD's back to get
the 1200 no HD.

I won't even discuss the problems we're having getting 4000's in...

>
>
>==
>

Actually, I found that, though you could boot up the program, switching back
to 16 MHz would cause their custom IKBD handler to fail. (Wouldn't recognize
most key and mousebutton presses.) This was on a Mega ST with Turbo-16 and on
a 4160 STe with Adspeed. That was one of the factors that had me going with
Cubase 3.01 instead...

>>>Does anyone know where I can get a fixed pitched font for Pagestream? I
>>
>>Hmmm, my copy of Pagestream had a fixed pitch typewriter style font with it.
>>(German version 2.1)
>
>My UK verson 2.2 has Times, Triumverate and Garamond compugraphic
>fonts, and several SoftLogik fonts (can't remember which ones), but no
>Typewriter font, and no fixed pitch font.

Quoted from Soft-Logik via GENIE during Feb/93:

"The Font Plus Pack has been discontinued because new copies of PageStream 2.21
include these fonts in the package. (PageStream now comes with 47 fonts!) If
you purchased PageStream prior to the start of this offer, you can buy the
former Plus Pack fonts from Soft-Logik sales for $10. Call 1-800-829-8608."

"Font Plus Pack: there are 11 families, 35 fonts. These are the same as in most
PostScript laser printers. You get the DMF font for each family, plus the
metric for each weight/style, so that there are 35 fonts. Plus screen fonts."

"Font Plus Pack: they are DMF/FM format fonts. ... They are still commercial
fonts which we sell as part of PageStream."

The fonts (as named on a HP LaserJet IIIsi Printer PostScript Font Page)

ITC Avant Garde Gothic * Book, Book Oblique, Demi, Demi Oblique
ITC Bookman * Light, Light Italic, Demi, Demi Italic
Courier * -, Oblique, Bold, Bold Oblique
Helvetica * -, Oblique, Bold, Bold Oblique
Helvetica Narrow * -, Oblique, Bold, Bold Oblique
New Century Schoolbook * Roman, Italic, Bold, Bold Italic
Palatino * -, Italic, Bold, Bold Italic
Times * Roman, Italic, Bold, Bold Italic

plus Symbol, ITC Zapf Chancery Medium Italic, ITC Zapf Dingbats

Since you already have Times & Triumverate,
they don't include Times & Helvetica.
They also don't include the .PS files since they assume your PostScript
printer has them.
If your PostScript printer doesn't have them, I guess you're out of luck.
(The Digital ScriptPrinter that I sometimes use doesn't have
ITC Bookman, Helvetica Narrow, Palatino, ITC Zapf Chancery Medium Italic, or

ITC Zapf Dingbats but does have ITC Lubalin Graph and ITC Souvenir)
If your printer isn't PostScript, they'll print fine.

The fixed-pitch, constant-width, typewriter-like font is Courier.
I used this for 8 1/2" x 44" banner and it came out quite nice on my 9-pin.

Nine additional font families for $10 is worthwhile whether you have
a PostScript printer or not.

Silly me. In the READ.ME, if your PostScript printer doesn't have them,
remove the .PSF file and they will be printed using the .DMF file.

] window GEM window. Absolutely NO problems with sluggishness. Works
] perfectly. Have you included serialfx in your auto folder. What about
] a serial buffer?

I'm not using a VAX machine, I am using an *ATARI*!
With GEM, not CLI's!

All the programs I've seen have been incapable of keeping up with redraw
speeds of 19.2K (Connect, using the 8-point font can't even keep up with
2400 on this machine, STFM, without any screen-accelerators), it's
not too bad with the standard system font though!

Serial-fx makes very little difference to screen updating speed!

I can use FZDSTerm at 19.2K perfectly, screen keeps up quite happily
with the RD light on the modem!
```

I always thought they would do about 300 a day, that would make about
10000 a month - if all works fine. What it didn't do until last month.

>There has to be around 250,000 out there so far.

Really? Where? Not here in Germany - and nowhere else, too. I would say
10000 is the maximum at the moment. ATARI sold some 50000 computers
last year - not in a single month.

>How are they doing NEAR you? Dealers?

But the FALCONs are coming now, and they are sold out as soon as they
land at any dealer in Germany. Some dealers got 10 to 15 during the last
2 month - nor much really.

>With GEM, not CLI's!

You missed the point.

Actually, I have to ask a stupid question at this point; what exactly
DO you use terminal software for?

Many of us use programs like STalker, Connect, Uniterm, etc. to
connect to minicomputers/mainframes that are (among other things)
Usenet hosts. I.e. - I'm using Uniterm at this very moment to connect
to a Sun Sparc 10 (and I then telnetted to another Sun Sparc 10, but
you don't want to know about that :-), and am running a process called
"trn" - the Threaded Newsreader.

On top of that, in order to followup your post, I'm running a
subprocess to trn called "emacs," which I'm using to compose this
message.

I have found that Connect and Uniterm provide flawless support of
VT200 and VT220, which means (for instance) that GNU-Emacs works
correctly. At 2400 baud, a ^L takes an unfortunately perceptible
amount of time, but the IMPORTANT point is that it works CORRECTLY.

There's a CLI here in the process; that's really completely
irrelevant, and it is silly of you to bring it up as an issue. It's
not as if we're likely to be running a GEM interface to UNIX over a
serial line. Possibly technically plausible, but a really stupid
idea, as it would take more effort than it would be worth to develop
it.

If CLIs are evil, then why do YOU use terminal software that clearly
is NOT designed to interface with the "other end" using a proper GUI
interface? I believe that there's some special software out there
(Aladdin?) that provides a GUI interface to GEnie; I suppose that
you've found an Atari product that does the same thing for Usenet?

>All the programs I've seen have been incapable of keeping up with redraw

>I can use FZDSTerm at 19.2K perfectly, screen keeps up quite happily
>with the RD light on the modem!

Yeah, but what terminal support does it have? I played with it, and
was very unimpressed. It has a pretty user interface, but if it ain't
VT100 compatible (or better), and I mean TRULY compatible, then it's
really not worth using.

i did say it should be buffered i think. Or maybe i didn't here.

Actually there is no chance i will do any such thing for the simple reason that i have an STe with the combined mmu/blitter. Do you know of a 16MHz source on such a machine.

>For HD Floppy support, it is best to use an integrated 16MHz quarz
>oszillator - these are cheap and provide a good quality signal.

i wanted to keep component count down. But i suspect you may be right.

Here in England nothing is cheap. (except words ;-)

Adam.

What is an MMV ? <FX: penny drops>.... Monostable multivibrator ?

i was just going to have a 6ms step rate. i can't visualise exactly what you are saying: Some kind of delay before you switch step rates i gather ?

Adam.

6303. ST:TKW, v4.04 - (TREK0404.ZIP) - fix!

Newsgroup: comp.sys.atari.st
Date: 1993-05-01 05:38:49 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1rt2d9INNe2a@golem.wcc.govt.nz>
Source record: 206530

To anyone who has downloaded the file TREK0404.ZIP from the
./Games/
directory in the atari section of atari.archive.umich.edu, and not
been able to get it to work, here is the reason!

The files need to be put into directories, as such:/

Create directory called STARTREK
In this directory create 3 other directories, called GRAPHICS, SAVEGAME,
and SAMPLES
In the STARTREK\GRAPHICS\ directory, put all files ending in PUT
(Copy *.PUT into that directory)
In the STARTREK\SAMPLES\ directory, put all files ending in SMP
(Copy *.SMP into that directory) - also, copy the BASCODE.EXE file into it!
In the STARTREK\SAVEGAME\ directory, if you wish to start the game
anew, then don't copy anything into this, and lose the GAME.0?? files,
as well as the HISTORY files!

Into the STARTREK\ directory, copy the TREK0404.PRG file, and if you
wish, the TREK0404.DOC file. (Sorry ^^^^^^^^^^^^ should be
STKW0404.PRG!)

After copying these files into the correct directories, the game will
then load & run correctly!

(I'm not the author - just someone who was determined to make it work!)

6304. Atari ST stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1993-05-01 05:47:58 UTC

Na John, they have all moved to the PC groups,
who would in his right mind own a Atari to-day..??:-)..

Up in Auckland New Zealand, thay did have the best support for the Atari here,
well there have no Atari BBS's there now..

Here in Wellington we have the Z-Net Atari support BBS, with a direct
feed from Bob Brodie, plus all the Atari Fido feeds..

May be you need to come to Wellington John, plenty of PC cloned around..:-)..

Hia,

I recently got my hand on a used SLM804 and aer now looking for a spooler
that supports the DMA port or whatever it takes to prevent it from locking
up the screen while it prints. I'm quite pissed off by this.

Anyone knows?

Grateful if anyone can send me a pointer as this is killing me slowly...

6313. Re: MACophiles and Amigoids, please go away

Newsgroup: comp.sys.atari.st
Date: 1993-05-01 14:06:45 UTC
From: generic@rahul.net
Message-ID: <C6Cpv9.5xI@rahul.net>
Source record: 206544
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

The Atari 800 and 400 almost identical internally. The key differences
that make an Atari 400 different than an 800 are the plastic membrane
keyboard and only one rom cartridge slot instead of two. Things like the
processor, graphics chips, etc are the same.

Atari 800/400 cpu is a 6502B running at 1.79 megahertz.
The orginal graphics chip was the CTIA followed some years laster by the GTIA.

The 800 was introduced with only 8k of memory, (I have seen a 4k cartridge
so I assume at one point they were thinking about that).

It may interest some of you to know that the 16k cartridge and the 8k cartridge
are also very nearly identical. Both carry 16k chips, but the 8k cartridge
has been wired so that only 8 of the 16k are accessable. For those with
some soldering experience the conversion of the 8k board to the 16k board
is not difficult.

Interesting though it is, is it something to be proud of to have loads of versions of the OS? I'd much rather them get it right when they release it and only release major upgrades to the OS, such as 1.0 -> 1.6 -> 2.0 -> 4.0. I think they are when the OS really changed a significant amount (though you may say that 1.02 was fairly important too).

6315. FALCON INFO

I'm not sure if this is the right newsgroup to post this in, but my server has few Atari groups and this seems the most likely place to post. Anyway, I would like to request some information about the new Falcon 030 from fellow netters.

1) Are the rumours of a price increase true?

2) Is there going to be a MultiTOS OS shipped with the machine, or will it have to be purchased separately?

All info is welcome. Please respond via E-Mail, as I do not read this newsgroup. Thanks much.

Well then, it would explain why the U.S. hasn't seen any yet.

I don't think I would send units to the U.S. if I could sell them without
even advertising in France or Germany.

I wonder if Atari will increase production?

>
>I always thought they would do about 300 a day, that would make about
>10000 a month - if all works fine. What it didn't do until last month.

That is pretty bad. 10,000 a month? If they do 10,000 a month, they MIGHT
be able to sell 100,000 the entire year.

For a company that bases everything on MASS production and MASS selling,
Atari isn't doing so hot.

The reason they price their computers as low as they do is so that they
can make money when selling in volume.

>
>>There has to be around 250,000 out there so far.
>
>Really? Where? Not here in Germany - and nowhere else, too. I would say
>10000 is the maximum at the moment. ATARI sold some 50000 computers
>last year - not in a single month.

Yes, but we both know the computers that they were selling last year were
old technology. As soon as news about the Falcon030 hit sometime in
March, sales of all their computers fell tremendously.

I'd be surprised if they are selling ANY computers now.

>
>>How are they doing NEAR you? Dealers?

6318. Question about Music Synthesizer programs

Newsgroup: comp.sys.atari.st
Date: 1993-05-01 17:20:04 UTC
From: cordes@ac.dal.ca
Message-ID: <1993May1.142004.13324@ac.dal.ca>
Source record: 206602

Hello,

Our club disk librarian is interested in music programs and he just sent
me the message below. If anyone can offer a useful suggestion I'd be
pleased to hear about it. Thanks.

==========
Re: Music Synthesizer

I'm interested in finding a program that allows continuous, variable sound
production from the sound chip using either mouse or keyboard. The ones I've
seen so far either allow one to design a single sound, or to read from a file,
but nothing that really allows instrument like playing with all the variables
the chip can produce. Could you check Internet for me? I looked through the
Michigan database ansd didn't see anything quite like this. Thanks.

6319. The future of Atari...

Newsgroup: comp.sys.atari.st
Date: 1993-05-01 17:40:02 UTC
From: frisk@complex.is
Message-ID: <340@complex.complex.is>
Source record: 206601
Cross-posted to: comp.sys.atari.st,misc.invest

I am looking for some opinions on the future of the Atari company...the reason being simply that the Atari stock (ATC) is now trading around an all-time low, at around $0.81/share and I was wondering if the stock might be a good buy right now.

Once I really liked what the company was doing - I had an Atari 800 back in '80 or '81, but for the past few years the company does not seem to have been able to do anything but lose money.

However, they recently started shipping (at least in Europe) the first decent product I have seen from from them in years ... the Falcon 030 - which will probably not affect their earnings until the next quarter - in the last one they lost a good bit of money, as expected. I don't know exactly how the production of the Falcon is growing, but the local distributor tells me the demand here is far higher than the supply.

So, does anybody have any opinions on the future of Atari ?

Well, my biggest problem with GEM based programs that scroll is the fact
that even with Quick ST, scrolling is painful on the eyes because the text
changes color as it scrolls. (With the default colors you can make out the
text being red, green, and then black as it scrolls.)

The only way around this I've found is to make all the colors black.

Then Bob Sayeth to Ricky:
Do you know what multitasking is? Atari has had it since the ST came out.
Macs have had multitasking for a long time. Amigas. Unix boxes. And
now, MushDOS machines have it with WhineDoze. Take an operating systems
course at your friendly neighborhood college, huh? Dweeb. Dweeb. Dweeb.

What Atari is getting now is PRE-EMPTIVE multi-tasking, something Macs and
SquishDOS machines don't have with System 7 and LoseDoze, the primary GUI of
those platforms.

P.S. Purists please note, I speak of the PRIMARY OS of each platform, not the
obvious plentitude of third-party products that do anything you want to do,
anyway. Richard, please get an Email address so I can flame you in private.
And no, we can't get c.s.atari.advocacy at this site.

That's the same problem I've had; even after taking out -DMULTITOS, I
still haven't been able to build a kernel that will let me get to the
GEM desktop. It loads tcsh finely as a shell, but dies if I try to go
to GEM.

As Director of Communications (or whatever), it's his responsibility to
be looking after everyone and anyone that calls Atari. He should have
lackeys to answer his FAX machine and look for lost orders, etc.

Heh. Sam's said lots of things... like that they'd be shipping thousands
of Falcon030s every month starting in Aug.92; it's almost Aug.93 and they're
still rarer than diamonds.

The Atari 400 and 800 were released in 1979. They ran at 1.79 MHz,
exactly half the NTSC colorburst frequency. The 800 was released at
the same time as, if not before, the 400. It also came with 16K of RAM,
officially upgradable to 48K (as opposed to the 400 which had no Atari-
supported RAM upgrade path).

>4. 1983. While the computers sold well, they appear to be losing a war against

>(at some tome they released the 5200. A video game system based on the
>atari 400. I'm not sure when this happened. It was a failer)

Commodore had better marketing than Atari. Their advertisments actually
made it look like a better machine.

>5. 1984. The video game industry when bust and alot of companies where

>the nintendo, a surperior machine, although also developed in 84 had bet them
>to the punch)

I've said it on many other newsgroups, and I'll say it here. My belief is that Warner's selling of Atari to Jack Tramiel was the _cause_ of the industry downslide, not the result. If Warner had not split apart and sold Atari, the 7800 would have been released in 1984, possibly holding Nintendo to a tiny market share. Also, Atari probably would have retained the Amiga, and with Atari's arcade licenses intact all the popular arcade games would have been available for the Amiga.

Atari was the undisputed videogame maker from 1977 - 1984, from videogames to computers to arcade games. But as Atari grew it was managed more as a traditional big business, a fatal mistake for a market that requires creativity and innovation. Warner, instead of trying to salvage the company, took a tax write-off and sold it.

The intense interest in comp.sys.atari.8bit and rec.games.video.classic proves that the videogame demand was not dead in the early 80's. It was the _supply_ that was dead. With Atari out of the picture, there was no supply.

>5. 1985. With the winter CES Tramiel Atari released the 130ST, the 520 ST and
>the 65 XE. The ST line (ST stands for Sixteen/Thirtytwo) were revolutionary

>nick-named the Jackintosh.
>The 65 XE and the 130 XE were updated 8bit versions of the 800xl. I can't
>find what xl were released and when.

The introduction of the Atari ST was an incredible marketing coup against Amiga. When Commodore stole the Amiga from Jack Tramiel, Jack had the ST designed in six months. The price/performance ratio was phenominal, mostly because the entire OS, a very much Apple-like GUI, fit in less than 512K of ROM. Compare that to 10MB of hard drive space for Microsoft Windows. Coupled with 3.5" floppy drives that weren't brain-dead like the Amiga's, it was not necessary to purchase a hard drive for an ST. In fact, with an entire megabyte of memory to burn, you just put everything in a RAMdisk which of course was even faster than a hard drive. The slowness of followups, couple with the release of the Amiga 500, 2000, and its Kickstart 1.3 OS killed the ST a bit prematurely.

>6. the time between 86 and 91 is very hard for me to track info down. I was

>the 7800 and the XEGS.
>8. 1992 to present. Things look pretty bad..
>

>ok, anyone care to fill in details or point out my mistakes in the time line?

You did not cover the splitting of Atari explicitly. When Warner sold Atari to Jack Tramiel, it kept the arcade games division. Warner eventually broke that off too, and it became Atari Games. Last I heard, Warner bought back Atari Games. Also, Tengen is a subsidiary of Atari Games; Tengen makes software for the NES, Genesis, Amiga, etc.

>extra software to make things work properly!)

Regardless of whether I used Connect or not, I'd still have a screen accelerator installed to speed up the desktop, etc. That slowness is attributable to the Atari itself (well, the code used in its AES/VDI I suppose). My guess is that Connect was written to use AES/VDI so it should be compatible with future systems/resolutions etc, and thus had to live with the good points and bad points of AES/VDI. BTW Connect works fine without Warp9, but does alot better with it :-)

>If I turn the scroll-bars off, things are a bit better!

It makes it easier to work with VI as well :-) (since if I have scroll bars on, the top line is hidden behind the menu bar, but with no scroll bars, everything looks fine)

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...I'd be curious to see how Connect works on a TT or Falcon (with and without a screem accelerator)...

The bug in GFA version 3.6 is that it fails to restore the memory when the interpreter enounters a second RESERVE statement. I haven't encountered any other memory bugs in GFA either, but then I've switched to using Mshrink() due to the interpreter bug.

3.5 doesn't have that bug, if memory serves, and in the bug isn't there when 3.6 programs are complied (it's a bug only in the interpreter).

One interesting note about the 'price wars' that Atari and
Commodore engaged in. While Commodores marketing did indeed
tend to depict the C-64 as a better machine than the Atari,
the ultimate victim of this battle was Texas Instruments.
The TI-99 was being sold for *less* than it cost TI to
produce the thing. We all know what happened.
TI dropped out of both the war, and the market to produce
a viable home machine.

I can also remember some stuff that K-Mart was using to sell
the C-64 over the Atari. It was a 4 or 5 page comparison of
the two machines that was loaded with blatant lies and
mis-truths about the Atari. Too bad Atari didn't sue the
crap out of them for that, but 'tis no use crying over spilt
milk. When it comes to aggresiveness, Atari had and still has,
a backbone made of jelly.

There is a shareware program out there that converts RTF to WWST and
vice-versa. Word Writer ST is probably the best "true" word processor
out there for the ST (not some graphics-dump program like Word Up, et.
al.)

Maybe someone knows the ftp site that has this (I have the program
on disk, and could up load it if no one knows its where-a-bouts.

Well, my biggest problem with GEM based programs that scroll is the fact that even with Quick ST, scrolling is painful on the eyes because the text changes color as it scrolls. (With the default colors you can make out the text being red, green, and then black as it scrolls.)

The only way around this I've found is to make all the colors black.

Later.......

Well, what machine are you on ? Tos 3.05 or 3.06 on the TT does not have this problem, while 3.01 did. (That is without screen accelerators, I dunno what they do to the blitting code)

Erling

Yeah, but what terminal support does it have? I played with it, and
was very unimpressed. It has a pretty user interface, but if it ain't
VT100 compatible (or better), and I mean TRULY compatible, then it's
really not worth using.

It works fine for what I use, apart from the boxes looking a bit odd, it
works perfectly well!

I'm only running an 8Mhz STFM, with a color monitor, so STalker, Connect
etc. is completely useless to me! FZDSTerm however works quit well!

I coinne

I connect to this VAX/Unix machine, assorted BBS's, chat modes, IRC,
all of which work fine with FZDSterm. I don't need the latest fanciest
bits 'n' pieces with all the unnecessary (in my case) terminal emulations.

I just stick to what I like, and what works, and that's fine!

Works fine on F030 with NVDI. I agree with comments about VDI, etc. NVDI
should have been put in the ROMs. As it is not, everyone should buy
a copy. It works in _all_ F030 resolutions and Connect looks very good
in 640*480*16colours.

6347. ****** For sale, Atari 1040STf and other stuff

Newsgroup: comp.sys.atari.st
Date: 1993-05-02 02:17:52 UTC
From: GOMBMIK@chico.acc.iit.edu
Message-ID: <1993May2.021752.26253@iitmax.iit.edu>
Source record: 206630

For Sale ....

Atari 1040 STf, Tos 1.0, 2.5 Meg using ZRam, socketed CPU all in a vertical
and very LARGE tower case. IBM style 200W power supply.
Keyboard is the original from the 1040. The
mother board is installed in the tower case along with a 720K 3.5 and a
360K 5.25 drive. 1 drive slot empty. All the ports are brought to the
outside except the MIDI and the expansion connector(never used them).
Audio out is also available.
A clock is installed on the motherboard but I no longer have the software
to set it. I do have the software to read it and set the keyboard clock.

This is a total hackers machine but can be used by anyone.
All the modifications done by yours truly. The system works really well
and hasn't given me problems for ages.
Asking for $350.

Color Monitor SC1224. No burn in but the speaker has a notable noise problem.
Asking for $100.

Epson LX80 9 pin printer. This is a workhorse of a printer that has served
me for over 6 years. Still works great.
Asking for $50.

Seagate 20Meg hard drive and a ICD SCSI AdPlus controller with clock. The drive
is in a seperate box with space for another one. The box is kind of beat up
so its yours for free.
Asking for $200 for the ICD and the hard drive. Software already loaded
and preconfigured.

720K 3.5 drive. Plug and play with intenal ST connector $30.

RS232 25 pin T switch $5 or free to anyone that purchases the 1040 as a system.

Atari ST Internals and Atari ST Gem Programmers Reference. Free with system.

I am willing to part with it all for a mere $600. I would prefer to sell
as a system but will seperate. I would also prefer to sell in the Chicago
or within a 1.5 hour drive, however I will ship the hard drive or the printer.

Reason for selling. Upgrading to either a Falcon or a laptop and I can't
justify two machines. (Sigh...)

THX

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: ??.??.??
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5
Invalid handle.....-37.....6
Insufficient memory.....-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46.....15

No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

:FREE: ??.??.??
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

:MAGS: 93.05.01
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

('Suspened' from publishing...)

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany, Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

Swiss mags:

Atari ST News Schweiz

Dutch Atari ST Nieuws translated into German for the Swiss :-)

:TIPS: 93.03.01
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET: ??.??.??
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@spud.hyperion.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where

host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP: 93.03.01
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st
ARCS How do I deal with Archived files (.ZOO, .ARC, .LZH)?

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.01.30
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip21.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: ??.??.??
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

:CLI: ??.??.??
What Command Line Interpreters are available?
===

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

```
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault.....................-10
Read fault......................-11
General error...................-12
Write protect...................-13
Media change....................-14
Unknown device..................-15
Bad sectors on format...........-16
Insert other disk...............-17
Invalid function number.........-32............1
File not found..................-33............2
Path not found..................-34............3
No handles left.................-35............4
Access denied...................-36............5
Invalid handle..................-37............6
Insufficient memory.............-39............8
Invalid memory block address...-40............9
Invalid drive specified.........-46...........15

No more files...................-49...........18
Range error.....................-64...........33
Internal error..................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs
=========================================

User Interrupt Vectors......64-255
```

```
:GDOS: ??.??.??
What is GDOS, and where can I get it?
====================================
```

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

```
:GNU: 93.01.30
What GNU software is available for the ST?
=========================================
```

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.3.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX

Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: ??.??.??
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp

XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
==========
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM

program along with a lot of character-based programs simultaneously. MGR and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar package (it's not part of the standard MiNT distribution) modelled after TOSWIN and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==========

There actually is a port of XWindows to the ST now, although it is pricey. Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany
TEL: +49 8334 1411
FAX: +49 8334 6245
email: xtosinfo@xsoft.uucp
CPU:
Atari Mega ST, STE, TT
68000 to 68040
Memory:
2 Mbytes (4 Mbytes recommended)
Operating System:
TOS 1.4 or higher
Mouse:
Atari mouse
Graphics:
X/TOS/window/server:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
X/TOS/window/server/color:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
color 320x200x4
color 640x200x2
color 640x480x4
color 320x480x8

Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European keyboard
layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---

send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.03.01
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
=======================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

==
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Cross-posted to: comp.sys.atari.st,news.answers,comp.answers

Archive-name: csas-faq/part3

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st
MODELS All the models in the ST line
FALCON What are the specs on the Falcon?
ACCEL Hardware Accelerators
DRIVES What should I know about hard drives and the ST?
FLOPPY Can I use 1.44 meg floppy disks?
GRAPHIC How can I enjoy enhanced graphics on my ST?
JOY What joysticks work best with the Atari ST?
MODEM What modems work with the Atari ST?
MONITOR What should I know about monitors and the ST?
PCEM How can I turn my Atari ST into a PC emulator?
SPECTRE How can I turn my Atari ST into a Macintosh emulator?
UPGRADE Can/should I upgrade my ST?

:WEL: ??.??.??
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics

comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:

Name	CPU	RAM	TOS	B.I.	Extra	Comment
130 ST	8	/1	1.0	M		Never marketed
260 ST	8	/5	1.0	M		
520 ST	8	/5	1.0	M		
520 ST+	8	1	1.0	M		
520 STm	8	/5	1.2	M		
520 STfm	8	/5	1.2	FM		
1040 ST	8	1	1.0	FM		
1040 STf	8	1	1.2	F		
1040 STm	8	1	1.2	M		
1040 STfm	8	1	1.2	FM		
Mega 1	8	1	1.2	F	MB	

Mega 2 8 2 1.2 F MB
Mega 4 8 4 1.2 F MB
STacy 8 1 ??? F Laptop
STBook 8 1 ??? F Notebook
520 STe 8 .5S 1.62 FM AV
1024 STe 8 1S 1.62 FM AV
Mega STe 16 1S 2.06 F AV,MB,6U
TT 16/030 Just for developers
TT 32/030 S 3.06 F AV,MB,6U Various mem/HD configs
Falcon 16/030 S 4.?? F AV,FC Many enhancements!

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use them you need an adapter to convert them to SCSI. Adaptec 4000/4000A is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards availible. Adaptec has stopped production for quite sometime so look for these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put the drive internally, you will need a case with power supply to house the adapter and hard drive. IBM case is very easy to get and has a lot of space for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive they use about 20 watts or less, Quantum LPS drive use about 10 watts each, make sure your power supply has more than the drives need. Again if you use IBM case, the 150 watts power supply for that type case can drive at least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL), it's 50pins IDC female connector on each end with 50 conductors cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board. Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

:FLOPPY: ??.??.??
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync

monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases.

The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM

binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

6353. File Problem...

Newsgroup: comp.sys.atari.st
Date: 1993-05-02 04:40:00 UTC
From: palefox@carson.u.washington.edu
Message-ID: <1rvjb0INNemq@shelley.u.washington.edu>
Source record: 206636

OK, let me see if I can explain this clearly...

I'm trying to download sample files for my Ensoiq EPS sampler, using my Amiga, since I don't have a working term program on my ST. Once they're downloaded, I uncompress the file, which turns it into a disk image file that is about 820K. How do I transfer this file to my ST? I have a program that will write these EPS disk images to disk from the ST, but I need some way of getting the files onto the ST first.

6354. Re: File Problem...

] that is about 820K. How do I transfer this file to my ST? I have a
] program that will write these EPS disk images to disk from the ST, but I
] need some way of getting the files onto the ST first.

Pretty much the only way you can do it, is to download a terminal program
from somewhere, then de-archive it onto an Atari-ST or IBM compatible
3.5 disk. Then once you've done that, connect the two machines together
via null-modem cable, set both ends to 19200 baud (On the ST you will
need HS-Fix 1.4 or some such thing in the AUTO folder), then start
sending the file from the machine & receive it on the ST! (Preferably
with Z-Modem, but even grotty old X-Modem will work okay for this
task!)

Or, if available, one machine can call the other via-telephone & transfer
the data at the maximum-common baudrate of the machines!

(If you have access to an Amiga, you can download the file onto there
and use a program like Cross-DOS, to convert the files onto an IBM
type disk (ask in comp.sys.amiga for more info on this program & it's
similar clones). If you have access to an IBM, or machine with a
compatible disk-format, then download the file onto that, and use
that disk in the ST! (If you don't have the program to dearchive the
files on the ST, it will need to be done on one of the other units!)

Or, if you really can't get the terminal software, try to locate a
PD-library, they'll have *something*!
(Or, maybe some kind netter near you could help - go 4 it guys!)

6355. Anyone know what happened to SmoothTalker?

Newsgroup: comp.sys.atari.st

Message-ID: <H.6rYsPMnDTLo@uparker.uucp>
Source record: 206639

Hi everyone,

I was looking through some old disks yesterday and found a demonstration of a speech synthesizer called SmoothTalker. The quality of the speech is really quite high and it has a rather clever windowing system built in (non-GEM). The disk is so old, that I didn't really expect it to work but it does, even on my TT. I have no other information on the product - not even a readme to tell me where it came from. I was wondering if anyone else had heard of SmoothTalker and knew what had become of it?

>in 640*480*16colours.
>
>Ofir ogal@cix.compulink.co.uk

All the rubish talk about ConNect and how good it is on my TT or Falcon..

My comments are to do with a Standard ST/e colour and mono, its useless
in ST medium Res colour and the font is to small in the mono mode, so come on
you chaps please read in what is posted..

If you can't read , Don't post...

NOTE: no one has come back and stated the ConNect is better than Flash,
if ConNect was in the lines of Flash then it would be OK, Trapido is a bit like
that uses a full screen with a hidden menue bar, but I will agree that the
VT100 emulation is far from it, no boxes and did even cut a character of the
screen..

What I wan't is a full screen with a 8*8 font, Flash gives me that 100%,
ConNect does not, its as simple as that..

So come on chaps get out your Compilers and start working..:-)..

Or have we lost all are brians to the other side..:-)..

Roger.............. sheppard_r@kosmos.wcc.govt.nz

Maybe it's got some unusual (i.e. non-ST/TT) display requirements or has been
ported to run under MultiTOS properly...

Pam Software offers an ACSI ethernet adapter for DM 1800.--
approx., including the PamsNet software. As far as I recall,
there's a similar thing at a similar price available from BioData
(the network is called BioNet).

>The compiler works fine, but the Interpreter is to smart to punish you. :-)

I may be stupid, but I don't see why the compiler or the interpreter should punish anyone for the code given above. After OPTION BASE 1 and DIM mstrip$(totalcount+1), there's absolutely nothing wrong with reading stuff into the mstrip$() array via a loop FOR i%=1 to totalcount+1. The loop will run over array elements mstrip$(1) through mstrip$(totalcount+1), which is exactly the size of the array. Besides, the interpreter doesn't do any sort of "smart" error recovery if one tries to access array elements out of range. Rather, it will produce an appropriate error message in an alert box (unless an ON ERROR statement was executed before).

6364. Just ordered a Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-05-02 14:36:58 UTC
From: saj@chinet.chi.il.us
Message-ID: <C6ELxM.vw@chinet.chi.il.us>
Source record: 206648

I went to my local Atari dealer and played with the Falcon 030 he has on display. Sure enough, there are lots of video modes, and some of them are very nice. He had Pagestream 2.1 installed, but configured wrong...I fixed the setup (with permission, of course) and ran it a bit. Some other people were taking turns with me beating on the machine. My impressions: most predominant one is that AES still needs to be re-done from scratch. Screen painting is horribly slow. Next is that Multi-TOS is a bigger change than it sounds like in a short description, and will take getting used to (I'd guess that even though the overhead is modest, most people won't load it for most GEM sessions). The speed difference from a Mega ST on Pagestream was dramatic, but the slow screen painting made the program look slow anyway. Sure enough, the audio performance (using Paula and a pair of tiny amplified speakers) was spectacular.

I ordered a 65/14 model. I don't know list, but actual price was $1750 plus tax. Delivery promised in 2-5 weeks. I was #5 on the order list.

I expect to have some frustrations with the machine, but it's an improvement, I mostly work from a command line where Multi TOS will be more useful, I can use the extra RAM space and the price is within reason.

>POSIX, i guess, needs a memory indirection which the Atari cannot do
>(therefore, swapfiles are not possible in the way Unix or VMS do).

There seems to be some confusion about MiNT, MultiTOS and POSIX. It is MiNT that contains the POSIX-like interface. MultiTOS is MiNT plus multitasking AES, VDI etc. etc. -- it's what's in MiNT that counts!

POSIX is an OS *interface* standard (Portable Operating Systems Interface based on uniX). Nothing in POSIX "requires" virtual memory per se, but you'd be pushed to implement the semantics of fork() without it!

From examining the system calls provided by MiNT, it is my guess that MiNT has been heavily influenced by POSIX. For example, signal handling follows the current POSIX draft, and directory handling is done POSIX-style.

I can't give an accurate answer as to how POSIX compatible MiNT is, since I've been away from both POSIX and MiNT for a while. Furthermore, POSIX is still a draft standard, and therefore changing all the time. OSes claiming to be POSIX compliant lag behind. For example, it is only recently (i.e. in the last year) that SunOS and Irix have implemented POSIX threads.

>> Townsend (aka the "TOS God") has left. And they are having a fire sale of
>> ridiculous "odds and ends" of parts left over in Atari warehouses (send
>> GEmail to G.LABREC on GEnie for info).

Let's be fair: John left a month or so back because he got a great job offer from Taligent, *not* because he was laid off or because he didn't want to work for Atari anymore. It was a natural progression in his career; and while we certainly will miss him, the TOS group will be able to continue work without him.

As for the warehouse: why in the world *shouldn't* Atari sell its old inventory? It's not doing any good sitting in the warehouse.

I'm not going to pretend that everything is rosy at Atari. Of course we had problems last year, especially when the Falcon was so late... no company is going to do well when there's no product to sell :-(. But that is changing now. Rumors of Atari's death have been greatly exaggerated.

As usual, these are my own personal opinions, not my employer's.

>>last year - not in a single month.

I don't thing the word manufacturing is in Atari's vocab...10,000 a month is
nothing. That means that there will hardly be any software for the Falcon..

Commodore sold 100,000 Amiga 1200's in the UK from last November to February of
this year. C= probably sold that much in Germany too and C= Australia sold
70,000 Amiga 1200's. I don't know what sales of the A4000 line, but are out of
stock in the U.S.

Atari will never change..History is repeating it self.

Source record: 206656
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Can some one tell me how I can auto-start Gemini using STARTGEM.PRG in my AUTO-folder, STARTGEM.INF in the root directory containing "C:\GEMINI.121\GEMINI\GEMINI.APP" which is the location of GEMINI?

I have a Mega ST4 with TOS 1.2. My boot partition is C:, and Gemini is also on C:.

I used to auto-boot GoGo ST 4.2 using this same method and GOGOST.PRG was/is in a parallel directory on the C: drive. I'm not sure why this isn't working.

Help!

Alsom please reply via E-Mail since I'll only have access to this account for this week (finals week :( ) and may not too much time to get back to the net... Thanks!

Umm, the Amiga 1000 that I have has an original drive and can read 720k
DOS disks, and Atari disks with a simple utility. It also allows long file
names, something that is still a problem for Atari, as evidenced by talks
on the other Atari newsgroup. Mac drives are the brain dead ones.
>drive for an ST. In fact, with an entire megabyte of memory to burn,
>you just put everything in a RAMdisk which of course was even faster
>than a hard drive. The slowness of followups, couple with the release
How do Atari RAM disks work? Like Amiga RAM: (grows and shrinks and is

always there), or like RAD: (has to be mounted and is fixed size, and recoverable after warm boot), or like MS-DOG (has to be mounted is fixed size, can cause conficts with some progs, dies after warm boot)? Just curious.
>of the Amiga 500, 2000, and its Kickstart 1.3 OS killed the ST a bit
>prematurely.
The original Kickstart ROM release was 1.2. It did not support autobooting hard-drives. I always liked having a kickstart disk, instead of ROM.

We do. However, Power Packer is a runtime uncompressor. It comes with
a 6k powerpacker.library that handles the decompression. Since I hear
that Ataris can do everything the Amiga can, it shouldn't be that hard
to write an uncompressor on Ataris to handle this. There are also
ppshow and ppmore programs to view compressed pics and text files. With
WB2.1/3.0 and Multiview, it's possible that ppacker be handled as a datatype.
Perhaps enterprising Atarians can do the same on their systems.

Hmm, I'm running it in ST/e Mono, and the font I'm using (Gemini-Bold-10) is
quite comfortable to the eyes. I wouldn't say it's "useless" in ST medium,
but it won't display the full screen in that mode...

>NOTE: no one has come back and stated the ConNect is better than Flash,
>if ConNect was in the lines of Flash then it would be OK, Trapido is a bit like
>that uses a full screen with a hidden menue bar, but I will agree that the
> VT100 emulation is far from it, no boxes and did even cut a character of the
>screen..

Boxes boxes - load in Connect and do the following: go to the SETUP menu
in your window, then choose the NATIONALITY option - in that screen there
is a option for "Character Set" - just change ATARI to VTXXX, exit out,
and you'll have the *full* VTxxx/ANSI character set (Connect defaults
to the Atari set).

Gonna avoid "this term is better than that term" arguments (well,
maybe I'll send ya some email :-). My main gripe with Flash is that
I like to access everything possible via mouse, whereas Flash ya
need to use the keyboard for some options - this is obviously personal
taste and not judging the "quality" of how things are done.

Just curious - has anyone run Flash under MultiTOS yet? How's it work
in that environment?

>What I want is a full screen with a 8*8 font, Flash gives me that 100%,
>ConNect does not, its as simple as that..

Just like my comment on Flash - a matter of personal taste defines
our choice term program. On a ST this probably won't be - on a newer
system (TT/Falcon) this will be (8x8 full screen font, that is).

>So come on chaps get out your Compilers and start working..:-)..

As soon as I get enough disk space to do something useful with GCC :-)

>Or have we lost all are brians to the other side..:-)..

Source record: 206694

Has anyone heard about Calamus (SL?) coming out for Windows on the PC?
I was talking to my Atari dealer, letting him know Calamus is the main
reason I have kept my ST, and he said "they are coming out with a
Windows version" of it. (What a great way to keep Atari customers!)

I just wanted to know if he was having delusions of grandure or is
there some facts to it?

Keep on truckin' (that's all we can do now...)

>come on you chaps please read in what is posted..

It's useless to YOU. What's useless to you may be useful to others of
us.

>NOTE: no one has come back and stated the ConNect is better than Flash,

I've used CoNNect and Flash, and will state publically that I prefer
CoNNect. I find that CoNNect is more useful to me than Flash. You
may interpret that to mean that I have "come back and stated the
ConNect is better than Flash," if you wish.

>if ConNect was in the lines of Flash then it would be OK,

I presume that you mean that "if CoNNect did not use a standard GEM
interface" it would be ok?

>What I wan't is a full screen with a 8*8 font, Flash gives me that
>100%, ConNect does not, its as simple as that..

If Flash makes you happy, then be happy. Don't dump on CoNNect
because it happens to cater to a different (and apparently fairly
large) sector of the Atari population.

I would note that there have been a LOT of copies of CoNNect and
STalker sold/registered. Apparently there's a lot of Atari users that
like to use them.

>So come on chaps get out your Compilers and start working..:-)..

Why don't YOU stop bellyaching and get out YOUR compiler and start
working on something that YOU will like. Of course, you might have to
do icky UNIX-like things like getting a C compiler to do the job. (C
{\em must} be evil, wrong, and a lousy language. It was created by
the designers of UNIX!)

>
>The Amiga-Lorraine was developed by a company seperate from Atari was it
>not? I know that many of the people working on it were ex-Atarians, but
>Atari really could not retain it since they did not own it.

Atari loaned money to Amiga, Inc. to fund the development of the Amiga. While Atari was being sold to Jack Tramiel, Commodore bought Amiga and paid off their debt to Atari. Apparently legal, but the ethics are questionable.

>Umm, the Amiga 1000 that I have has an original drive and can read 720k
>DOS disks, and Atari disks with a simple utility. It also allows long file
>names, something that is still a problem for Atari, as evidenced by talks
>on the other Atari newsgroup. Mac drives are the brain dead ones.

Reading ST & IBM disks on an Amiga is even slower than reading Amiga disks. As you probably know, to read a single disk sector the Amiga must read the entire track of _raw_ data, then the 680x0 decodes the MFM encoding. Coupled with the fact that the directory structure is a linked list, practically the entire disk has to be read every time you want a directory.

>How do Atari RAM disks work? Like Amiga RAM: (grows and shrinks and is
>always there), or like RAD: (has to be mounted and is fixed size, and
>recoverable after warm boot), or like MS-DOG (has to be mounted is fixed
>size, can cause conficts with some progs, dies after warm boot)? Just
>curious.

Due to the abundance of memory, it seems everyone and his brother wrote his own RAMdisk. I just used the first one I found, which was fixed-size non-recoverable (and with the huge capacitor on the 1040ST's power supply, the RAMdisk could retain its information after 10 seconds of no power -- handy for thunderstorms).

>The original Kickstart ROM release was 1.2. It did not support autobooting
>hard-drives. I always liked having a kickstart disk, instead of ROM.

My mistake. I meant to say Kickstart 1.2. When 1.2, the 500, and the 2000 were released in 1986, it was the death of the ST.

>What happened to Atarisoft? They made Atari games for other platforms.

I believe that was just a product name used by Atari and not a separate entity. I could be wrong.

Basically, Jack Tramiel wanted to turn Atari into a computer company, not a game company. That is why he killed the 7800 just as it was being shipped to distributors. And presumably, that is what happened to Atarisoft as well. Actually, it's Tengen (a subsidiary of Atari Games) that now makes the software for the other platforms. I guess all the arcade license went with Atari Games in the split and not to Atari, because I believe it is Tengen that makes the arcade conversions for the Lynx, not Atari.

Hello everyone!

Recently I read a message, making reference to a programme called "Ancient Art". As was said in the message, "Ancient Art" can be used to transform *.IMG files into ASCII-pictures.

I would be very interested in such a programme. Should anyone know where to ftp it, would you please e-mail me (as I don't read this group regularly).

Best thanks,
Markus

Greetings, all. I hope I haven't made a bad decision. I just bought an Atari 520ST. I am interested primarily in playing games--I had been looking at 8-bit Ataris (the 800/400/XE/XL series), but found a killer deal on the 520ST.

I'm primarily interested in playing the classic games--Centipede, Defender, Joust, Pole Position, Pac Man, etc. Is the ST a good choice for this? Or should I cancel my deal before it gets completed?

Thanks for your input!

Daniel

Since the message I'm replying to has a couple different authors in it,
I'll gear some thought toward the comments, not the authors (as I forget
who's who anyways :-)...

>>My comments are to do with a Standard ST/e colour and mono, its useless
>>in ST medium Res colour and the font is to small in the mono mode, so
>>come on you chaps please read in what is posted..
>
>>What I wan't is a full screen with a 8*8 font, Flash gives me that
>>100%, ConNect does not, its as simple as that..

The argument is one of design philosophy. Flash fulfills the needs
of the above commentor, whereas Connect does not (based on his definition).

Based on how Connect is designed and what its options are, I would
hypothesize that Connect is *designed for* those people who

1) like GEM-based programs
2) have at least a resolution of 640x400 (assuming you want the full
screen displayed)
3) have a MegaSTe, TT, Falcon, or above (to take advantage of the
hardware's benefits, such as multiple serial ports, etc)
4) have a graphics card or hardware with resolutions above the 3 ST modes
(TT/Falcon resolutions, using Crazy Dots and similar graphics boards,
using a resolution emulator such as MonSTEr...)
5) want multitasking (as it works well under MultiGEM, and probably under
MultiTOS, in part due to its GEM design)
6) a combination of 3&5 (have multiple sessions running on multiple ports)
7) etc

In turn, programs like Flash, Flash II, Uniterm, and other similar programs
would seem more designed for those who

1) want full screen display
2) have a ST/STe
3) wish to run in color (ST medium mode?)
4) want compatibility with current script files (Flash II using Flash's
DO files, for instance)
5) have no need/use/ability for multitasking (Flash and Flash II don't
seem to run nicely under MultiGEM, I dunno about MultiTOS; also
running MTOS or MGEM *might* be a bit sluggish in 8mhz)
6) want the most screen speed on their ST/e (due to perhaps custom
screen handling)
7) etc

Both the Flash and Connect crowds have the ability to do various
emulations, script files, protocols, etc.

Am I saying Connect is more powerful? Yes. Am I saying Connect is
better? No. I am saying that it depends on your needs. For instance,
if you have a ZYXel modem, you may find great use out of Connect's
"answering machine" capability - if you don't have one of these modems,
you obviously don't need that option. If you want to use a port
other than Modem 1 (and MIDI), Connect is a good choice - if you don't need/
want this, or have no use for this (ST/STe) then you don't need that
option. This can be said of Connect's other various options (such as
the "Sounds" capability - which is more of a "nicety" than a "necessity").

For instance, since I run in ST mono usually, I have little use for
the "Colors" settings. However, if I run in a color mode (ST medium, ST
low, or one of the TT/Falcon color modes) I may be able to take advantage
of the colors (for instance, getting a full 16-color ANSI mode on a
640x400x16 resolution, etc). It depends on what you need and want.

>If Flash makes you happy, then be happy. Don't dump on CoNNect
>because it happens to cater to a different (and apparently fairly
>large) sector of the Atari population.

All that typing, and he makes the point in 3 lines :-)

>I would note that there have been a LOT of copies of CoNNect and
>STalker sold/registered. Apparently there's a lot of Atari users that
>like to use them.

'Tis why I registered. I should mention that while the above comments
were as a general comparison of Flash and Connect, the many many other
term programs may fall on either side of the comments. STalker, for
instance, would seem most similar to Connect's way of doing things, whilest
Uniterm more parallels Flash...

>Why don't YOU stop bellyaching and get out YOUR compiler and start
>working on something that YOU will like. Of course, you might have to
>do icky UNIX-like things like getting a C compiler to do the job. (C
>{\em must} be evil, wrong, and a lousy language. It was created by
>the designers of UNIX!)

Relax folks - this is almost beginning to turn into a "MIBTY" war
("mine is better than yours" war, for the acronym impaired :-)
The benefits and detriments of Unix and other OS's are yet another
example of different design philosophies and "target audiences."

Folks - take advantage of the power of shareware - download the many
available shareware term programs (atari.archive.umich.edu has almost
every one in existance :-) and try 'em out. If they suit your needs,
then send in that registration and enjoy! (Flash, being a commercial
product, can't do that to - HOWEVER there IS a Flash II DEMO for those
of you that want to test it out). Be happy that there are people
that are still developing and enhancing products for the Atari
(Connect and Flash II are of course being presently supported by

their respective authors).

Well, hope this message helps cool down the debate a little - no need to get upset or offended because of a terminal program, computer brand (Atari, Amiga, etc) or anything else of the like. Just find what ya like, and enjoy! (and pose questions when you need some help figuring things out)...

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm preparing to do alot of TOS and GEM programming, and HSC no longer suits my needs, and MWC never did suit my needs. I'm going to go for GNU C, but I noticed there were ALOT of different files.

I'm definately going to be using MiNT, and I'll be getting the distrib-kit over the next few days, but what I need to know is what is necessary for GCC, and C++. I'll be grabbing the MiNT lib too, but again, there are a million different ones that seem to be the same version. And some things are listed under GCC but don't seem to be part of the compiler. Can someone tell me the bare minimum required?? I mean, do I need all those Update files? What about all that stuff in the New directories?? What's the current version of GCC, and are there any docs on how to set it up? and what files are required if there was a doc telling me what was required I could use that to find the other files.

Any help would be greatly appreciated. Thank You.

Jeremy Konopka (konopkjt@mercury.cs.uregina.ca) wrote:
> BTW, why is it being said that MTOS is too slow on stock 68000 ST's? Is it
> the overhead of the OS, or the machine design?

There are various reasons. One of them is OS overhead, especially
because pre-emptive multitasking is an extension to standard TOS
and not a really integral part of it. The more important reason
is that old software treats the ST as a single-tasking machine
or as a machine with cooperative multitasking only. Hard disk
drivers, for example, wait in a tight loop after they initiate
DMA transfers instead of going to sleep until the transfer is
completed. Thus, the whole disk I/O time is lost for the
applications. Similar things apply for other device drivers.

With new HD drivers, the situation should improve considerably.
Re-compiling TOS with a better compiler would also be a wise
step, and a general VDI speedup (using techniques as in NVDI)
would give the UI a much snappier appearance.

The machine itself is definitely not too slow for real
multi-tasking purposes. Mag!x seems to prove that, as a lot
of people keep telling me.

I do connect to a VAX and need VT100 and with a ANSI Font, I used the font
that came with ConNect, not very good on mono at all..

>
>>NOTE: no one has come back and stated the ConNect is better than Flash,
>>if ConNect was in the lines of Flash then it would be OK, Trapido is a bit like

>
> Just curious - has anyone run Flash under MultiTOS yet? How's it work
>in that environment?

Please tell me how do you run MultiTOS on a one meg ST, and also there are no
Atari dealers here and no Falcons..

Please tell me how do you use the mouse to press Funtion keys, or do you Type
with the mouse, how do the keys take it..:-)??

Have you ever used Falsh, the one that Alan Page wrote..?

> Just like my comment on Flash - a matter of personal taste defines
>our choice term program. On a ST this probably won't be - on a newer
>system (TT/Falcon) this will be (8x8 full screen font, that is).
>

>
>...my main reason for liking Connect is that it takes advantage of my
>hardware - all three serial ports on my MegaSTe (I've got other
>reasons, but that is the most important *to me*...
>

No I don't like software that forces me to do abnormal things, software should go forwards, I don't find that ConNect is going Forwards, Rufus was going forward then turned around and went backwards, Trapido has promise but I think that the author has given up..

I have noticed that the Great German commercial program don't use Gem the normal ways plus they don't use GDOS...

Also note: New Zealand leads the light of day, so we must do things different than those that are left far behind, may be you need to come to this part of earth and find out for your self..??

Its the Air here, its far to clean..!! makes us think..we are not all Foged up..:-)..

>
>I think there's a copy of a port of "find" (ported by Hildo; a very busy
>guy!) on cs.ruu.nl (or is that ftp.cs.ruu.nl?).
It is ftp.cs.ruu.nl.

I tried the program under MiNT (works great!) and under plain TOS1.4 (doesn't
work).

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'find' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/mint/find-37.zoo

--> How to get 'find' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.

| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl

or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/mint/find-37.zoo
end

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service and/or the mail-server, feel free to drop me a line (by e-mail, please).

6397. Printing from TouchUp

Newsgroup: comp.sys.atari.st
Date: 1993-05-03 09:38:26 UTC
From: marc@targon.UUCP
Message-ID: <3117@targon.UUCP>
Source record: 206680

I'm having trouble with printing on an SLM804 from within TouchUp.
When I try to print the current image, TouchUp says
'Laser printer error!'.
This happens with both 'SLM' and 'GDOS handle 21' selections.
Printing from a selected image even crashes the system.
Is this solveable?
And what's new in the newest version? I think I'm running 1.78.

Marc

Yea. The ST is a great game machine. You couldn't tell that from the posts in this group however. Most people seem to be interested in making the ST look like a Unix box. I enjoy programming on my ST, but I would be interested in hearing from game programmers (I know you are out there... or else the games section of atari.archive.umich.edu wouldn't be so big.)

What compilers do you guys use??? What is the best method to display graphics on the ST??? Have you written portable libraries of game functions???

Yup. You can't really try and tell us that Amiga drives aren't very peculiar. I'd love to know why Amiga did their directory structures like they did (though I think I remember hearing something about disk-fixing), because my friend's A500 GVP harddrive used to take as long to read a directory as my Atari floppy drive, especially the root directory!

I personally have both 8bit and st joust, ST joust gets real close to the original, all the way to the flames eating the bottom level, both are good ports but the ST version looks better and is a litlle faster.
8-bit version doesn't have the vultures return to the hatchlings, st does
I don't think any of the original special occurances (like killing multiple pterries off the low center platform) work, except the phantom platform doesw happen on the 8-bit, don't remember how to do this so I can't say for sure if the ST version does (something you do with two players and basically kills off player 2)...

my 8-bit software has all the classics, pole position, gyruss, centipede, Q-bert, Pac-man..., but some of the other ST programs are phenomenal.
But the 8-bit has some gems too, specially Zybex and Draconus, MasterBlaster II.

Either way you go, you will be satisfied, There is no doubt in my mind that these programs exist, the hard part is where...

Well, basically, the 8-bit definitely does have these programs, ST? all I am for sure is joust. There is also a lot of shareware programs for the ST that are close to the classics, Megaroid (asteroids), LLamatron (robotron like), Space invaders...

Well, that is enough ranting on my
part, hope this was helpful

Sorry Eric, I never meant to imply that John was laid off. I know of the Taligent job and all Atarians should wish him luck, even though we'll miss him a lot.

>As for the warehouse: why in the world *shouldn't* Atari sell its old
>inventory? It's not doing any good sitting in the warehouse.

I agree. It's just unusual timing, IMHO. And that kind of stuff is seldom sold to the public. But like you say, why not?

>I'm not going to pretend that everything is rosy at Atari. ... Rumors of
>Atari's death have been greatly exaggerated.

I agree on both counts. And my PUBLIC apologies for my previous post with the rather sarcastic comment about "the fat lady warming up in the wings." Quite inappropriate for a public post, especially from a dev. To be honest, I was upset about Gail Bacani leaving Atari, I had just read D.A.Brumleve's treatise on the current state of piracy, and was having a "bad hair day" as well. Of course, _every_ day is a bad hair day for me! :)

Fair Dinkum will continue to support Atari users as long as we can. In fact, look for an announcement of an exciting new product coming very soon. :)

>Atari loaned money to Amiga, Inc. to fund the development of the Amiga.

Wrong. Amiga Inc. was founded by 7(?) doctors etc. who wanted to invest money in something profitable. After a while (sometime 1984/1985) the money was all gone. Amiga Inc needed more money and Atari loaned them $$$. The development(sp?) went on. They came to a point where the loan from Atari took an end, and they had to look for more financial backing. Atari made a shitty offer for the stocks in Amiga Inc, and at the last moment C= made an offer which was twice what the pesimistic people at Amiga Inc. had hoped to get. So Amiga Inc. pays back the loan to Atari and becomes part of C=.
There might be finer legal points to the story, but I don't know those :).

>While Atari was being sold to Jack Tramiel, Commodore bought Amiga and
>paid off their debt to Atari. Apparently legal, but the ethics are
>questionable.

_IF_ Atari had paid for the initial development I would have agreed, but they didn't.

[about the Amiga diskdrives]
Much of the speed/slowness of disks of the Amiga boils down to a question of software. If 1.0 had the same optional filesystems that 3.0 has then Amiga disk drives would never have been called slow I think. The caching of directory entries is rather smart.

(And I still would like to find the source to StXformer :)

>Is there a TeX for Atari? If so, where can I ftp it from?

TeX does exists for the ST. The best configuration is C_TEX which
can be had on umich I believe. It comes as a nicely archived bunch of files
distributed on 4 DS disks with an INSTALL. Also, get metafont (C_MF) and the
two FONT disks. These 8 disks give you a complete TeX/MF working environment
with a GEM shell. All in all, its pretty easy especially if you understand
German! :-)

In a previous article, ersmith@netcom.com (Eric R. Smith) says:

>>In article <1993Apr27.142343.6950@newshost.lanl.gov> hutch@bellman.lanl.gov writes:
>>> the Atari "revolving door" has been so busy of late that there is only a
>>> handful (literally!) of people left to do the job required of a hundred.
>>> Long time developer support person, Gail Bacani, just recently left the
>>> company. Atari Explorer magazine is being reorganized (again!). John
>>> Townsend (aka the "TOS God") has left. And they are having a fire sale of
>>> ridiculous "odds and ends" of parts left over in Atari warehouses (send
>>> GEmail to G.LABREC on GEnie for info).
>
>Let's be fair: John left a month or so back because he got a great job offer
>from Taligent, *not* because he was laid off or because he didn't want to
>work for Atari anymore. It was a natural progression in his career; and while
>we certainly will miss him, the TOS group will be able to continue work
>without him.

Yes, let's be fair. I originally thought that people may be leaving Atari
because or problems within the company. But, instead of ASSUMING that this
was the case, I contacted them and found out why they left.

For the most part, they left Atari because they were offered a job that
they have DREAMED of doing for a very long time.

Each one said that the company tried to convince them to stay (most likey
by raises), but they resigned because it was an advancement in their
career as Eric has said.

Some did say that they were getting a little bored with thei job, but only
because they didn't have time to experiment and develop new things,
NOT because they had any problem with anyone at Atari.

Also, I hate to say this... But, Atari is not in the best financial shape.
These people most likely have a more secure job elsewhere.

>
>As for the warehouse: why in the world *shouldn't* Atari sell its old
>inventory? It's not doing any good sitting in the warehouse.

Heck yes! They should get rid of their old inventory and make room for
the Falcon030, Lynx, and Jaguar.

There is NO reason Atari should have that much inventory when the company
is releasing new products.

They could use that money to start more manufacturing plants (something
the company REALLY REALLY REALLY needs to do), to make and store new

products, and to promote their new products.

How many of you REALLY plan on purchasing a 520 STe or 1040 STe in the
near future? Or for that matter, a Mega STe?

It would make A LOT of BUSINESS SENSE to discontinue everything but the
Falcon030, Lynx, and Jaguar.

My gosh, Atari is going to have to produce over 100,000 Jaguar systems
a month if they even want to even TRY to get video game market share.
Nintendo was producing 800,000 SNES systems a month when they first launched
it in the U.S.

I think Atari had something like $85 million in inventory last year. That
is an awful lot of old inventory.

>
>I'm not going to pretend that everything is rosy at Atari. Of course we
>had problems last year, especially when the Falcon was so late... no company
>is going to do well when there's no product to sell :-(. But that is changing
>now. Rumors of Atari's death have been greatly exaggerated.

Eric, I really hope you are right. I hope Atari has LOTS of Falcon030s
to sell.

There was a rumor (no one knows for sure) that Atari was producing 10,000
Falcon030s a month. This number should be 50,000+.

The Lynx number should be 100,000+. The Jaguar number should be 100,000+.

But, I do want to say that everyone should watch what they complain about.
If you complain that Atari is discontinuing the Mega STe (not saying they are)
and the company cannot sell any more due to the Falcon030, Atari's management
may attempt to continue the Mega STe even though they shouldn't.

Think what is in Atari's interest, not only your own.

In article <1s2m5mINNn8c@golem.wcc.govt.nz> sheppard_r@kosmos.wcc.govt.nz writes:
>I do connect to a VAX and need VT100 and with a ANSI Font, I used the font
>that came with ConNect, not very good on mono at all..

I've found Gemini-Bold-10 to be a decent font in mono. I'm not positive,
but I dunno if the *font* will limit you to whether or not you can do
ANSI characters - if the Language is set up to VTxxx then I *think*
you could use another font than Connect ANSI and still get the proper
character set...

On this subject - is there an easy way to tell (short of loading
them in) if a font is proportional or fixed-size? (maybe something
that could be done in batch, like a "fonttype *.fnt" or similar?)...

>I was refering to Trapido, and note you have to use a ANSI font for a VAX..?
>hey I have been in Computers/Electronics for some 30 years, so I should no
>what is good bad..???

Sorry - I misread which term you were referencing (Trapido). Are you
talking about VAX/VMS or VAX/Unix? (the University of Pittsburgh, where
I went to school, had both operating systems on their VAX). If I remember
correctly, I think you could set different emulations in both systems
(at least between VT100 and VT52 if nothing else). Oh well, as long
as your term of choice handles the needed emulation...

>Please tell me how do you run MultiTOS on a one meg ST, and also there are no
>Atari dealers here and no Falcons..

You probably can, but you won't have much memory to work with :-) Using
MultiTOS will depend on how much memory your system has (obviously)
and perhaps what speed impact you can work with. I'm on a 4meg MegaSTe,
so using MultiTOS will be an option for me (I currently use MultiGEM).

As for Atari dealers and Falcons - gotta kick Atari for that one :-)

>Please tell me how do you use the mouse to press Funtion keys, or do you Type
>with the mouse, how do the keys take it..:-)??

Well, I'm still looking for a program/accessory that will display the
character set, and then I would just have to click on it to send the
character :-). I suppose I should've said that I want to do as much
as possible without having to touch the keyboard (yes, the ultimate in
laziness!). Seriously, I could've sworn I've seen such a program/ACC
in either the MAC or Windows world - I'd imagine that it could be done...

>Have you ever used Flash, the one that Alan Page wrote..?

Yep - I have the Flash 1.6 disk sitting in my commercial disk box. I even have the ACC that I believe allows remote access (never had the chance to try that out). I used Flash for a little while until I got Uniterm, and then stuck with Uniterm. Just to test things out, I ran Flash under MultiGEM - it didn't seem to coexist too nicely there (basically the same problem that other programs that use "full screen" have - like Arc Shell, for instance). Of course, if you're not going to be using MultiTOS/GEM then this is not a concern for you.

>No I don't like software that forces me to do abnormal things, software should
>go forwards, I don't find that ConNect is going Forwards, Rufus was going
>forward then turned around and went backwards, Trapido has promise but I think
>that the author has given up..

You have me slightly confused here. Could you explain what you mean by "going forwards?" (kinda hard to make a point on something if I don't know what is being discussed :-) One definition may be that Connect is "going forwards" in that it will take advantage of newer hardware/software if you have it, but will still work without that additional hardware/software. Using VDI will for instance slow things down compared to Uniterm/Flash/etc, but it may turn out to commit more compatibility as new hardware/software is released (MultiTOS being an example). Your comment about Rufus makes it sound like it got dizzy :-)

>I have noticed that the Great German commercial program don't use Gem the
>normal ways plus they don't use GDOS...

Normal ways? (again, I'm slightly confused). The neat thing about Connect is that you don't *have* to use GDOS fonts, and really you don't even need to LOAD GDOS to use the fonts - Connect can use them regardless of whether GDOS is present or not - thus using fonts is simply an option, not a necessity...

>Also note: New Zealand leads the light of day, so we must do things different
>than those that are left far behind, may be you need to come to this part of
>earth and find out for your self..??

I wouldn't mind visiting NZ, but I can't say I have the $$$ to do so (not sure what the NZ exchange rate is for $$$:-) Since I'm in the U.S., I'm also in a different "world" than Germany/Europe. One thing about internet: it sure makes you think about a global way of doing things :-)

For my needs, I only use Connect and Aladdin (the latter is a GEnie front end program). Like the old disclaimer goes: "your mileage may vary"...

>font running in CoNnects windows. If you are not able to find/install
>an appropiate font - Don't post...

So then, CoNnect is a good terminal program IF-AND-ONLY-IF you have a monochrome monitor.

If you have a colour monitor, you should really look elsewhere, as you are not very likely to receive satisfaction from the poor text quality. Folk such as Herr Wander are never going to help you rectify this situation, as they are too keen on making you appear the ass.

Of course, there is always Uniterm -- which uses the ST system font. A bit pedestrian for monochrome monitor users, I suppose, but adequate for speeds up to and including 19,200 baud. DEC VT100/200 emulation is very nice, although one tends to go into TEKTRONIX graphics mode when encountering a large amount of line noise, for example, when one's wife lifts the receiver on the phone extension in a room down the hall to make a phone call. Uniterm, alas, takes the entire screen when it is running, so I don't know how useful it is under MultiTOS -- perhaps some brave soul would care to test it and let us know the results?

Once again, I am in need of someone to translate some docs for a German language Atari program into English. I also expect to have a future need (RSN) for an English->German translation project.

If you are fluent in both languages and are looking for some fame (lots) and fortune (not much) then please contact me via email or leave a message at (505) 662-7236. I'll provide details at that time.

Ideally, I prefer someone with both Internet and GEnie access.

Cheers,

Well, I've had a couple of email requests for this article, so here it is.
I make no claims as to it's accuracy.

==========

SUMMARY OF DIFFERENT ATARI MODELS FOR ISSUE 1004

by Jim Trageser (trag@pnet01.cts.com)

For a company that has never learned how to market its products, Atari
has produced some of the best computer hardware in the history of home
computing. From the ground-breaking Video Computer System game machine
that revolutionized consumer electronics through the 400/800 family of
8-bit computers to the powerful ST/Mega/TT line of 16- to 32-bit
machines, Atari computers have generally been at the cutting edge of
electronic technology.

Atari's founder, Nolan Bushnell, is the man who made it all possible.
Inventor and developer of early electronic arcade games, Bushnell
targeted the home market in the mid-1970s with the legendary "Pong"
system. "Pong" was a largish console with two knobs on each side to
control the "paddles" on the television screen. With only one game,
the tennis-like "Pong," built into the system and no cartridge
capability, this primitive ancestor to modern electronic games was a
best-seller in its time.

A few years later, in 1977, the VCS (later designated the 2600) system
was released. With removable joysticks and/or paddles and a variety of
games available on cartridge, this system stormed the United States,
setting sales records that wouldn't be broken until the Nintendo
Entertainment System in the late 1980s. In addition to the Atari
games, companies such as Parker Brothers and Activision also developed
and marketed games for the 2600 as well as the Sears version of the
system, sold under license from Atari.

In 1979, Atari responded to the success of the Apple II and Radio Shack TRS-80 computers by releasing the Atari 400 and 800 home computers. Originally sold with just 8K and 16K of memory, respectively, and a cassette tape storage system, the two computers were based on the 6502 microprocessor, the same chip as used in the Apple and Commodore 64 machines. But the Atari computers were designed to use enhanced graphics, including 256 colors, by use of a separate graphics processor.

The 400 had a membrane keyboard, making it useless for touch typing, while the 800 had a regular keyboard. Both were upgradable to 48K of RAM. Soon, floppy disk storage systems became available for both computers, along with printers and modems, making them complete home computer system. Both Atari computers could also use televisions as monitors.

Both the 400 and 800 had cartridge slots for running cartridge- based software, although these carts were different from and incompatible with the 2600 game machines and subsequent game machines. In addition, the 800 had a second "right-hand" cartridge slot for future development, although few -- if any -- applications for it were ever released. Both computers could also use the 2600 joysticks, and had four joystick ports as on the game machines.

After Jack Tramiel left Commodore in the mid-'80s and purchased Atari from Warner Communications (who had purchased it from Bushnell shortly after the development of the 400/800), Atari upgraded the 8-bit computers with the XL variants. The XLs featured more memory (up to 64K), a different operating system than the 400/800, built-in BASIC, only two joystick ports and a sleeker case. Early XLs (600, 800 and 1200) had compatibility problems with the 400/800 software, crashed too often, and few were sold.

Atari also released the 5200 game machine as a replacement for the 2600 around this time. But the new machine couldn't use 2600 cartridges at first (an adapter was later sold) or joysticks. In addition, the graphics weren't much improved over the 2600 and not nearly as good as the 400/800. As a result of these problems, the 5200 never sold well either.

By around 1985, when the XE (65XE and 130XE) machines were released, Atari had ironed out most of the OS problems and all Atari 8-bit software, cartridges and disks, was running on most of the computers. The XEs had even more memory -- up to 128K -- than the XLs, the same built-in BASIC of the XLs and a more modern look tailored after the just-released ST line of computers built around the Motorola 6800 chip (which also drives the Apple Macintosh and Commodore Amiga).

Atari also released a third-generation game machine, the 7800. The 7800, which can still be found, escaped many of the 5200's problems. The 7800 has built-in 2600 compatibility, although it does not support the 5200 cartridges. The 7800 actually allows more colors on the screen at one time than the 8-bit computers, but the resolution is the

same.

Atari even released an XE game system. It was basically a 65XE with a detached keyboard and option keys. A few cartridge games were released, but the system died due to a lack of marketing.

The XL and XE 8-bit computers represented the last stages of 8- bit development in the computer world. They ran at a then- incredible speed of 1.79 MHz, and were probably the most-advanced 8-bit machines ever.

But by the time the XEs were being released, Atari was ready to push its new ST line of computers built around the already- mentioned 68000 Motorola processor. A few years earlier, Tramiel blew a deal Atari had with the Amiga company (founded by former Atari engineer Jay Miner, designer of the Atari 800) to develop a new 68000 computer and game machine, and had to start from scratch when Tramiel's former company, Commodore, purchased Amiga.

Atari then created the ST series of computers employing the same "Windows"-type environment as used on the Macintosh and Amiga machines. In addition, the STs can run Minix, a Unix-like environment from a third-party developer.

The 520ST (512K) and 1040ST (1028K) were released in 1985. At 8 MHz speed and able to address up to 4 megs of memory, the STs were far superior to the IBM XTs and ATs and far cheaper (less than $1,000 for a 1 meg ST) than the Macintoshes. A planned 260ST never made it to distribution, since 260K was not going to be enough with the desktop (TOS) taking up too much memory. The 520ST could be used with a television, while the 1040ST needed a monitor. Both had built-in Midi support and two joystick ports (one is always used for the mouse).

Within a few years, the STfm series was released, offering a built-in floppy drive, which was soon upgraded to double-sided, double density. And almost immediately after the ST was released came the first third-party emulators: devices which could allow the ST to run Macintosh or PC software. Today, several of these emulators offer over 90 percent compability with commercial Mac or PC software.

In 1989, the Mega series of ST computers was released, offering 2 or 4 megs of RAM (Mega 2 and Mega 4, respectively), room for internal hard drives and built-in clocks. In addition, the Megas had 16 MHz CPUs, as compared to the 8 MHz STs. The Megas also had detachable keyboards, while the STs had built-in keyboards. As with the XL 8-bit computers, the Megas offered compatibility problems with existing ST software. In addition, some of the Megas could not have simple memory upgrades.

Released shortly after the Mega machines, and utilizing a new operating system, were the STe (the "e" standing for "enhanced"). The new OS (called TOS 1.4) can be installed on older STs as well, although most current software supports both new and old TOS. The STe and Mega STe machines also offer stereo sound, up to 4,096 colors and

analog joystick input. A 1040 STe runs for less than $500, and a Mega4 STe costs about $1,200.

The Mega STe also allows for editing external video sources, and can read MS-DOS disks, converting the files to Atari format.

In the early '90s, Atari purchased the Lynx handheld game machine (similar to the Game Boy from Nintendo) from Epyx, and that system has met with great popularity.

Atari also purchased the Portfolio handheld MS-DOS computer from a third-party developer, and that machine has also met great success. Although marketed by Atari, it does not support any ST software and is a PC clone-type computer.

Last year, Atari also released its ABC (Atari Business Computers) line of MS-DOS machines, although they are being distributed mostly in Europe and do not support Atari software. These, too, are PC clones.

More importantly, in 1991 Atari offered peaks at the STacy and ST Book portables, both of which do support ST software. The ST Book features a "vector pad" instead of a mouse, up to 4 megs of memory, a high-resolution (640X400) LCD display, and built-in hard drive -- up to 120 megs. Both should be available within months.

Atari's latest and hottest domestically available machine is the TT/030, based on the Motorola 68030 32 MHz machine. While little software from the ST and Mega machines is compatible with the TT, the new machine is available with either TOS or Unix operating systems. The TT can handle up to 26 megs of RAM, has a math co-processor, multiple serial ports and extra graphics modes. In addition, the TT can utilize a 19-inch monochrome monitor. The TTs start at about $1,800.

The TT, Mega STe and ST Book can all access CDROM drives, bringing Atari owners back to the front edge of computer technology.

Rumors for '92 include a 64-bit video game system, a new series of ST computers that may be compatible with the new video game system, and maybe even a TT/040. Also, Atari enthusiasts are hoping for a domestic release of the Atari Transputer Workstation, currently sold only in Europe and running a version of the Unix OS, Helios.

This is your first outright lie. Rufus and Connect both use GDOS. Connect
lets you use fonts WITHOUT GDOS (don't know about Rufus). As far as your
'correct' GEM assertion, I find that German authors are more inclined to
add to the functionality of GEM, which I appreciate.

6420. *** BIG SALE *** reduced package price [sigh...]

Newsgroup: comp.sys.atari.st
Date: 1993-05-03 17:52:00 UTC
From: v115lue3@ubvmsc.cc.buffalo.edu
Message-ID: <C6GpJu.KEG@acsu.buffalo.edu>
Source record: 206553
Cross-posted to: comp.sys.atari.st,misc.forsale,comp.sys.music,rec.music.synth

I'm graduating and have to move this equipment out. It has served me
extremely well and will be missed. [sniff, sniff..] So here we go!

This is the perfect musician's machine, all you need to
do is pick the right MIDI software (not nec. included) that fits your needs.
Then when you aren't using the MIDI you can do word processing, desktop
publishing, log-in to bbs', print out whatever you need, etc (all included).

The prices work as follows: if I were to consider selling the items
individually, the prices I would be asking are listed w/ each piece. BUT,
I'm graduating in 1 1/2 weeks and would like to sell everything as a package;
soat the end of this message is what I'd like to get for the entire haul.
Depending upon the responses I get, I may be negotiable (try me :).

Package includes: all hardware, over 300 disks of software

*** Mega ST2 $600 (includes all upgrades listed)
- nice design, comfortable external keyboard, has room on the
motherboard to easily be upgraded to 4 meg

- MIDI ports

- TWEETY board installed (splits the ST's sound output into 2
channels to be played through your stereo)

- SWITCHABLE TOS 1.2/2.06 (the newest TOS, I installed the switch
myself; it allows you to have complete compatability with any
software by choosing the operating system it's most compatible
with. 2.06 is extremely fast and has TONS of features - nicer to
use than macs or windows IMHO)

- all the usual ports- parallel, serial, hard drive, 2nd floppy,
monitor, etc.

- golden image mouse

- extra atari mouse

- Warp 9 registered & installed

**20 meg hard drive $200

**SC1224 Color Monitor $200
- will accept either 60 or 50 Megahertz sinc

**SM124 Mono Monitor $125
- internally adjusted for maximum screen size

**2400 baud modem & software $50

**external DS/DD floppy $50

**Epson LQ-850 high speed 24 pin printer $200
(needs a ribbon)

**Navarone Video Digitizer $40

**Monitor Master $40

**Mouse Master $30

**2 Wico joy sticks $20

**software: $600
|
- I have ALMOST everything you could ever need/want - word
processing, telecomm, programming, graphics, music, games.
(I've got stuff that even I don't know I have)

I have *** 335 *** disks of software. Plus an additional 40 or so
blanks.

All appropriate cables, power supplies, and manuals are
included. All of the equipment is in extremely good condition.
Everything is clean and has been VERY well kept.

- I also have some of the boxes for the hardware (computer & 1
monitor I think.

****
Total cost = $2,155
****
******
I will sell it all for $1,100 <---- (that's $200 off from last week)
******

plus shipping (or will deliver within 1 hour driving time of Buffalo, NY)

If you are interested in what I've got, E-mail me at this account. I log
in daily..

.Philip

Yes, the 520 is a good choice. The graphics are good, sound is good...and even the 520 will be able to run all of those games you listed. It's really outdated nowadays, but for what you want it for it'd be great. Go for it.

Message-ID: <1s3nkm$74p@charm.magnus.acs.ohio-state.edu>
Source record: 206554

Well, I have just gotten into the fray of Midi. I downloaded Czphonics
from the archive, it works perfectly, but not for my Keyboard.
I was playing the hunch that my Casio CT-670 would be compatible, but that
was dead wrong. Is there any other patch editor I may want to try?

My problem is that when I am not in Midi, I can change any of the
following, attacks, decays, delays, and detuning through hardware on the
keyboard. But in midi mode, all of these nice features are turned off.

Is there any patch editor I should try? If not, I may have to write my own...
What would I need to do to access the controls of the keyboard? Any help?

RE: HUTCH's post
I had just read D.A.Brumleve's
treatise on the current state of piracy, and was having a "bad hair day" as
well. Of course, _every_ day is a bad hair day for me! :)

Well i got a chance to read D.A.Brumleve's post on piracy as well and i'm
not sure if it has been posted here or not (i can post it if need be)

I think we should discuss her article. What good does anyone here think her
article will bring? I read the article and can only think of two things it
will do.

1) Developers will read it and get even more disouraged (like you Hutch)
about atari's situation.

2) Average joe with a modem will read it and say "hmmm lets see i think i
will give *** bbs a call cauze they got some files i wan't

I'm not questioning piracy legalities just how is this article supose to
help anything.....

My dealer tells me that the TT I just bought was the last new one in the US. Lucky me...

Can't wait 'til the TT060 comes out with 2048 x 2048 pixels with 32 bit true color in a tower case and 500 MB HD standard comes out. Soon, I've heard. Whenever Motorola gets the 060 out on the market. I'm glad Atari is planning early for this one...they'll have the computers designed before the chip comes out. I think it was also 88 MHz wasn't it?

Yeah, that's it...

I found a copy of this program on the discount rack of my now defunct local Atari dealer. The package said it contained modules to call its speech synthesis from other programs, but when I executed the program, I received a message saying this feature was not implemented. When I sent in the warranty card, it was returned so I guess the company went belly up.

I hope I did not hurt your feelings...I am right...I see some Atari personal
were hired away to Taligent, inc. Of Course Taligent is Apple, since their HQ.
is at Apple's corpate office in Cupertino. I guess they wanted a real salary
with stock options and a chance to make history. Once the power Pc is out,
there will be no Falcon and Atari.. that is the hard truth...Why Atari cant
make enough Falcons and never will....As of last January, there is 40,000 Amiga
1200 in the U.S. , you should know, because its the Amiga that pays your
salary...Oh yes: At least 200,000 amaiga 1200 in the Uk and the same amount in
Germany..Oh yea another 70,000 Amiga 12000 in Australia..These figures do not
even include the A4000..

==========

Amiga 1200/80 ------ Must be in Heaven -------- Soon with Opalvision --------

Amiga 4000 toaster ----- There must be a god... --------------------------

Has anyone out there got some confirmed pricing (Retail/Wholesale)
of the Falcons? (Mainly the 4/65 and 16/65 units!)

I just visited an Atari dealer (only one in the Seattle area) on Saturday.
He had a 4/65 (store model). He said it will retail for $1300.00.

6433. Uniterm (was Re: CoNnect is great !)

Newsgroup: comp.sys.atari.st
Date: 1993-05-03 22:30:10 UTC

>one tends to go into TEKTRONIX graphics mode when encountering a large amount
>of line noise, for example, when one's wife lifts the receiver on the phone
>extension in a room down the hall to make a phone call.

This can be solved by hitting the key sequence (I'll describe keys to
avoid talking about menu bars):

Help
G ("G"raphics)

On the first line of the radio box (?) that appears should be the line:
"Tektronix Mode:"
and two boxes marked "Enabled" and "Disabled."

The Enabled box is activated by default.

Click on "Disabled," and save the setup (if you wish it to be the new
default).

Say goodbye to Tektronix mode. Which is, 99.9% of the time, what you
want.

>Uniterm, alas, takes
>the entire screen when it is running, so I don't know how useful it is under
>MultiTOS -- perhaps some brave soul would care to test it and let us know the
>results?

It works reasonably nicely under MiNT 1.02; unfortunately, it's a
little bit of a "problem application" in that it uses two screens, and
does it in a slightly non-portable way. (To be specific, I cannot
properly execute the SuddenView desk accessory from the Uniterm menu
bar, as SuddenView winds up unable to write to the right screen
memory. Whose bug is THAT? Responsibility seems pretty shared to
me...)

I'm pretty sure that Uniterm is NOT going to be a "MultiTOS compliant"
application, in the sense of being able to invoke multiple such GEM
applications and be able to switch between them nicely.

6434. vt100 emulator? or wait fizzdizz3?

Newsgroup: comp.sys.atari.st
Date: 1993-05-03 22:58:26 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1s482i$7md@charm.magnus.acs.ohio-state.edu>
Source record: 206564

I was wondering, would it be better to register for Freeze dried terminal now even though the newer version is supposedly coming out? I love the way the terminal is run, very well thought out, My only problem is how much memory call I allocate to a ramdisk and have space left over for the program on a 1040stf? How much longer is the wait? I will register, but I don't want to register again when version 3 comes out, that could be more money than I have to spend.

I do need to have a vt100 emulator, one that uses the arrow keys, supports the talk function through the internet(splits the window in two so that I can see what I am typing and what my friend is typing), can handle vi, emacs, fse editors. Will FDT III do this?
For the time being, is there a terminal program that can handle the above? and I can also download it from the atari archive? I can't wait to see what fizzdizz will do with vt100 emulation...

6435. Looking for check-writing program....

Newsgroup: comp.sys.atari.st
Date: 1993-05-04 01:17:20 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1993May4.011720.13929@oz.plymouth.edu>
Source record: 206565

[I'm looking for a needle in a haystack......]

I'd like to be able to print out checks using my ST & Deskjet printer.
While I could use a word processor (maybe) to do this..... I'd like to
use the checks I already ahve instead of having to buy then in sheets
just to print out.

Also, it'd be nice if it was a form of electronic "checkbook"....

I've got Phasar 3.0 from an old STart disk but it doesn't do what it
does in a very friendly fashion (After using MS-Windows for the past
few months it (Phasar) has a VERY unfriendly feeling interface (A TOS
program with a menu-bar grafted on...))

I'd prefer PD/Shareware to writing it myself.

Any pointers would be appreciated...

-AndyS-

Oh yeah. I guess the 1200 is the IDEAL platform to run Cubase Audio
on. Since it has a DSP built-in and fully supported by the OS
and of course MIDI ports, it must be the ultimate musicians' tool.
Better sell my Falcon and get an Amiga right away.

I have been to dozen of recording studios, from humble bedroom
setups to $500000 digital complexes and have never seen an Amiga
in any. Guess they should all sell their STs and MegaSTEs and get
a 1200.

They will only have one small problem... There is no bloody software
for the damned thing.

It was very funny to see the only Amiga stand at the MIDI show at Wembley
London. While the Falcon was the highlight of the show. The guy at the
Amiga stand fell asleep from boredom. There was no interest in his stand.
He was sitting there dribbling and snoring away.

I have many musician friends. Many use a computer to make music.
Most use an ST, one uses a Mac and one uses a PC. No-one I know
uses an Amiga to make music.

==========

Wake up. People use a certain computer beucause it's suited for
their main application.

One question? Do you get ST users in the amiga group telling you
how bad your computer is?

If you want a full screen, then ANY res supporting 640x400 or better will
give you full screen (TT modes, Falcon modes, Crazydots, ST Hi res, etc).
Depends on whether you want full screen displayed or not (it's still
functional - even had it running for the heck of it in ST LOW with MonSTEr -
got a scrolled 640x400x16 ANSI :-)

>If you have a colour monitor, you should really look elsewhere, as you are not
>very likely to receive satisfaction from the poor text quality. Folk such as
>Herr Wander are never going to help you rectify this situation, as they are too
>keen on making you appear the a**.

If you are limited to ST Low/Medium res and want a full screen display,
then perhaps Connect is not for you. Otherwise it works fine in any
mode you wish to run it in. Text quality is not the problem - it's whether
you want a 8x8 font full screen or not. Wander designed Connect for
a particular segment of the Atari population - if he doesn't see a need
for full screen then that's his decision (though adding a full screen
mode would knock out some of the complaints :-)

>Of course, there is always Uniterm -- which uses the ST system font. A bit

>MultiTOS -- perhaps some brave soul would care to test it and let us know the
>results?

Uniterm - the term I used until Connect came out. I can't say for sure
under MultiTOS, but Uniterm *does* function under MultiGEM (you have to
get to the "help" screen to access the other tasking programs and the desktop).
Should probably work under MultiTOS, at least in standard ST modes (medium/hi).

Hmm - I do remember people lifting up the phone and having Uniterms
screen go nuts (actually, sometimes a DISCONNECT will even trigger Tex mode :-)

I have heard that it has problems noticing the difference between 9 and
10 sector formats. I'm not sure if its in creating MSA files, or in
writing them back to disks.

I've been using Rufus 1.06 every once in a while and it seems to function well. I also have 1.10 and 1.119. I'd like to use one of the newer versions to see what's new, but can't get the to load. Has anyone else had any troubles like this?

Does anyone know the differences with the newer versions above compared with 1.06?

6445. Re: vt100 emulator? or wait fizzdizz3?

Newsgroup: comp.sys.atari.st
Date: 1993-05-04 03:42:26 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1s4on2INNrh2@golem.wcc.govt.nz>
Source record: 206570

] I was wondering, would it be better to register for Freeze dried terminal
] even though the newer version is supposedly coming out? I love the way t
] terminal is run, very well thought out, My only problem is how much memo
] call I allocate to a ramdisk and have space left over for the program on
] 1040stf? How much longer is the wait? I will register, but I don't want
] register again when version 3 comes out, that could be more money than I
] to spend.

The wait is until at least Mid-June!

I am running, UIS-III, Diamond-Cache, HS-Fix, Serial-Fix, and Back-pack
(taking up about 100k total!). And after running FZT v2.2, I still
have over 330k of RAM available. (On a 1meg machine), FZT needs about
80k to operate properly! (Or you can't have a scroll-back and still
be able to execute XYZ.TTP or FZDSXFER.TTP!)

On the reg' form is a 'wait until next release' box, tick this and
you will be posted out a registered version of FZT III if & when
it is released!

] I do need to have a vt100 emulator, one that uses the arrow keys, support
] talk function through the internet(splits the window in two so that I can
] what I am typing and what my friend is typing), can handle vi, emacs, fse
] editors. Will FDT III do this?

If FDT 3 supports standard VT100, it'll do this quite happily!
(Flash does, and that was written back around '87, and is described by
the author as being pretty awful! (Although, it's nice & simple to use!))

] For the time being, is there a terminal program that can handle the abo
] and I can also download it from the atari archive? I can't wait to see w
] fizzdizz will do with vt100 emulation...

If you want VT-100 emulation from a terminal program, your best bet is
Uniterm! (Connect would be better if you have a Mega-STE or higher).
But if you have an ST, Uniterm is probably the best around in the PD/SW!

> from Warner Communications (who had purchased it from Bushnell shortly
> after the development of the 400/800), Atari upgraded the 8-bit
> computers with the XL variants.

Wrong. The XL series of 8-bit Atari computers was developed under
the old Warner owned Atari. It was an attempt to reduce the cost
of producing the 8-bit machines so Atari could lower their price
to compete with the C64.

> Atari also released the 5200 game machine as a replacement for the
> 2600 around this time. But the new machine couldn't use 2600
> cartridges at first (an adapter was later sold) or joysticks. In
> addition, the graphics weren't much improved over the 2600 and not

Again the 5200 was developed by the Warner owned Atari and it was
nothing more than a redesigned 8-bit Atari computer and used all
the same chips and had exactly the same graphics capabilities.
Atari boneheadedly moved the memory locations of the chips in the
5200 and changed the pinout of the cartridge port so that 400/800

game cartridges wouldnt run on the 5200.

At one time there were no less than 3 versions of every game Atari
put out, the 400/800 version, the 5200 version and the 2600 version.
Retailers were none too happy having to carry 3 different versions
of the same game. Developers also werent too happy to have to rewrite
and repackage 400/800 games for the 5200 when they wouldnt
have had to if Atari hadnt changed the pinouts of the cartridges
and the memory locations of the chips in the 5200.

> Atari also released a third-generation game machine, the 7800. The
> 7800, which can still be found, escaped many of the 5200's problems.
> The 7800 has built-in 2600 compatibility, although it does not support
> the 5200 cartridges. The 7800 actually allows more colors on the
> screen at one time than the 8-bit computers, but the resolution is the
> same.

Yet again the 7800 was developed by the Warner owned Atari. They just
never got it to market in a big way before Warner sold the home game
division and home computer division to Jack Tramiel. Jack didnt want
to spend the money to tool up and properly market the 7800 even though
it was a better machine (100 sprites, anyone) than the NES. Instead
he tried to recycle the old 8-bit computer technology which had long
since been paid for and came out with the XE game machines.

> In 1989, the Mega series of ST computers was released, offering 2 or 4

> the Megas offered compatibility problems with existing ST software. In
> addition, some of the Megas could not have simple memory upgrades.
>

More misinformation. The Mega STs came out in 1988 and were exactly
the same as the regular ST except for the clock, the detachable
keyboard and a pseudo expansion slot. They did not have 16mhz CPUs.
The Megas ran at 8 mhz just like the regular STs. They also did not
come with the capability to use an internal hard disk. 3rd party
companies found a way to hack them in. As for the memory upgrades,
no ST model before the STE offered the ability to perform memory
upgrades. A lot of 3rd party companies came up with hacks to allow
this.

> In the early '90s, Atari purchased the Lynx handheld game machine
> (similar to the Game Boy from Nintendo) from Epyx, and that system has
> met with great popularity.

Atari didnt purchase the Lynx from Epyx, they got it when Epyx defaulted
on some loans that Atari had made them.

> Last year, Atari also released its ABC (Atari Business Computers) line
> of MS-DOS machines, although they are being distributed mostly in

> Europe and do not support Atari software. These, too, are PC clones.

Atari canceled its line of PC clones over a year ago.

> More importantly, in 1991 Atari offered peaks at the STacy and ST Book
> portables, both of which do support ST software. The ST Book features
> a "vector pad" instead of a mouse, up to 4 megs of memory, a high-
> resolution (640X400) LCD display, and built-in hard drive -- up to 120
> megs. Both should be available within months.

No more than a handful of either machine was ever produced and both
have now been canceled.

> Atari's latest and hottest domestically available machine is the
> TT/030, based on the Motorola 68030 32 MHz machine. While little
> software from the ST and Mega machines is compatible with the TT, the

Quite a lot of ST software will run on the TT and Atari Unix was never
released to the general public. Only a handful of copies of the Unix
OS were released and its now been canceled.

> Rumors for '92 include a 64-bit video game system, a new series of ST

> release of the Atari Transputer Workstation, currently sold only in
> Europe and running a version of the Unix OS, Helios.

Again only a few ATWs were released and those were never available in
the US. The ATW has been canceled.

: NOTE: no one has come back and stated the ConNect is better than Flash,

O.K. Here goes. I find CoNnect a lot better than Flash for a number of reasons. The ANSI emulation is a lot better, running an external program is a heck of a lot easier(i.e I can get an external download protocol to auto run) Having a built in UN*X like shell as a scripting language seems good too. All this I've found within the short time I've been testing it.

: What I wan't is a full screen with a 8*8 font, Flash gives me that 100%,
: ConNect does not, its as simple as that..

: So come on chaps get out your Compilers and start working..:-)..

Of course this is an option, one which anyone who is out there reading might consider. We do need a program which works faster on older machines without resorting to speed up tricks. I havn't found a problem with this but hen I'm using a 1200 modem :-)...

I've had no problem at all on a mono monitor, but if you want why not use
the fonts from rufus. They're ANSI and a little larger.

From: grw@ukc.ac.uk
Message-ID: <7134@falcon.ukc.ac.uk>
Source record: 206582

After downloading the binary distributions for GDB (versions 3.5 AND 3.6) i cannot get either of them to run on my STe. The moment I run them I get an ILLEGAL INSTRUCTION error from MiNT and that's it.

From reading the README.ST file, i get very little help, although I'm guessing that the two versions that I downloaded are 68030 only.

I probably will download the source and compile it myself, but just in case I can't find the time, does anyone know where I can get a working version of the binary (3.5 or 3.6) ?

Any help would be much appreciated....

Can anyone tell me the latest version of that excellent compressing Ramdisk Maxidisk? Where could I find the latest version - or could someone email it to me please?

I'm very glad to hear that Ian Lepore has a new verion of HSC almost ready!

I have an old 520ST with Tos 1.2 and 1M RAM (& two 1M FDD). I'm thinking of getting a Hard Drive. However - I reckon I might be better off getting a Mega STE since Tos 1.2 is slower for disk stuff, and lots faster all round - has Tos v2, blitter etc. I can get a HD for 280 pounds and Mega STE 4/48 for 695. (From memory those figures. Could be wrong)

Actually, MultiTOS (well, the MultiAES section, the bit which isn't MiNT), IS at version 4.0x. This is because the latest version is based on the TOS 4.01 version of the AES (3d buttons, etc). This I know to be true.......

There's a utility by Robert Best that converts between WP5 and First Word Plus (not graphics). Email him on mbdqbest@diamond.sara.nl (costs about $20 I think - pretty steep).

Why steep? This utility is NOT a beta version and I'm NOT paid to write such programs in my job. It is reliable, fast and easy to use. 20 US$ for a utility which is really useful is not much, even for students.

What would you consider a reasonable price? Do you know it? I can send you a demo version which does the same, but for short test files only.

Perhaps you should describe your problems in more detail.
If you want to use graphics (ANSI-graphics) you'll hev to install
an ANSI-Font (like the one that is included in the connect archive.)
Install it in the Display dialogue.
Next you have to set the ATARI-character set in the Nationality
dialoge. Keybord: IBM. In Compatibility: The first 2 popups: set them
to _not_ correct. Destructive backspace - ATARI-Keypad. The last popup
finally again: set it to _not_ correct...

Hello,

May I ask you netters for an opinion?

I have a five year old, barely used SLM804 Atari laser printer, which I would
like to sell to someone interested.

What price would YOU be prepared to pay for that printer?
Please respond by e-mail to the address below, as I DO NOT read this newsgroup.
(Though I still have my 520st ...)

Thanks for the answers.

Regards Robert

Lindner-Tex is also a very good TeX-Implementation for the Atari-St. I know
both TeXs. The TeXShell comming with Lindner-TeX I think is much better, but
the printer drivers are a little slow. Also the speed of both TeX-Versions is
nearly the same.

*
*Well, that was interesting. Four days with no response and then oodles within
*two. I want to thank everyone who helped my with my decision, and I want to
*give a special thanks to Mr. Peterson for reminding me why I don't want a Mac
*or Amiga. Namely, you don't barge into other people homes and start insulting
*their family. Thanks, Brian. ;)

I guess that Neuromancer didn't read my previous followup
explaining that it was SINCLAIR, >NOT< me (Brian Peterson),
who said he should buy an amiga or mac.

Neuromancer misquoted me.

He thought I said he should get an amiga, but REALLY, I
quoted Sinclair, who was the one who said he should get an
amiga.
And, By The Way, the other followup (than this very article)
to Neuromancer just happens to be from
Mr. Bozo-Breath sinclair2246@iscsvax.uni.edu himSELF.
(The >real< criminal returning to the scene of the crime. :-)

So, to summarize, I, Brian Peterson, think Atari computers
are cool. Someone ELSE said to buy amiga, and Neuromancer
attributed that to me.

DEATH TO ALL INTRUDER AMIGOIDS!!!!
Brian Peterson,
brianp@netcom.com

P.S. I think that when I made my followup
(which ended up as just me quoting sinclair2246 with nothing
of my own added (although it DID STILL have the line
In article <> sinclair2246@iscsvax.uni.edu writes:
in it)), I must have done something along the lines of
:w sinclair.followup
:q!
when I should have done a :wq instead of :q!
cuz I DID save a copy of what I was GOING to say.
Here I enclose what I originally intended to add.
I hope this settles everything.
BP.

*> 2) Get a Falcon030 as a 4/65 config and add an external SCSI II 120 meg HD.
*> 3) Get a Falcon030 as a 1/0 config and:

*Or you can get an Amiga 1200/80 meg for $868.00
*or Mac Centris 610 for about $1600 street.

This stuff belongs in comp.sys.amiga.advocacy. You can
stick it in comp.sys.atari.advocacy, if you really must.
C.s.a.a was created for exactly these types of articles.
Use it.
And in case you didn't notice, Neuromancer was asking for
advice on just three specific choices, all Atari.
None of the choices included Macs or Amigas.
If he wanted advice comparing Macs or Amigas, he would have
posted an appropriate question to the mac or amiga newsgroups.
Please don't post stuff that doesn't belong in this
newsgroup. It only annoys us.

Message-ID: <memo.188205@cix.compulink.co.uk>
Source record: 206369

To all Amiga users who keep posting annoying messages as opposed
to informative messages:

Every sane computer user on the planet knows that his system is not
perfect because such a thing does not exist. I am sure the Amiga is
great, but so is the ST. It will not benefit Amiga users if Atari
go bust, because competition drives prices down and pushes programmers
and hardware designers to excel.
You are not going to make any Atari user change over to the Amiga, because
he is already used to the system and probably quite happy with it.

I wish the Amiga much success and I am sure there are many applications
that run much better on it than on an ST/TT/Falcon. But the reverse is
also true. See my previous, not so calm, message about MIDI and Audio.
Let's face it the Amiga has not had much success in the music industry.

Have fun with your Amiga and leave us in peace. Unless of course, you have
something to contribute instead.

>Reading ST & IBM disks on an Amiga is even slower than reading Amiga
>disks. As you probably know, to read a single disk sector the Amiga
>must read the entire track of _raw_ data, then the 680x0 decodes the MFM
>encoding. Coupled with the fact that the directory structure is a
>linked list, practically the entire disk has to be read every time you
>want a directory.

You sounded like a man than knew what he is talking about. Right up to the
point where you said that the Amiga has to read practically all the disk
when you want a directory. The directory is hashed, this makes the seek
a lot faster than scanning the entire disk. Only 512 bytes of data is stored
for each filename unless it is a massive file. Traversing this is very quick
as usually only the tracks near the root block need to be searched. It is
very unlikely to see file information more than 10 tracks from the root block.

Also the blitter is used to decode the track data *not* the 680x0. This makes
is very fast. Far more versatile than the outdated WD1771 could evedr be.
You can have the best of both worlds - MFM and GCR.

Steve.

:
:There has to be around 250,000 out there so far.
:
:How are they doing NEAR you? Dealers?

Current issue of FUTURE MUSIC magazine in the UK has no less than 11 adverts from dealers selling Falcons FROM STOCK. Most common price is UKP 599 for 1Mb/0Mb and UKP 999 for 4Mb/65Mb.

All major tech-music/synthersiser shops sell Falcons. No messing.

Also many adverts for direct-to-harddisk recording software, plus reviews of forthcomming D2D/sampler/sequencer combo software packages.

FUTURE MUSIC magazine had many articles presenting the Falcon as the ultimate music computer (this is not necessarily MY opinion...). Also a nice quote from a head-to-head comparison of Atari vs. The Rest; "As for the Atari, well, name a recording studio without an Atari".

Only worrying point; Falcon seemed to be pushed as a souped-up ST rather than as a seperate, new computer. Not helped by identical casing perhaps? Mind you, virtually all old ST MIDI software is compatible anyway.

Screen painting was also slow on things like menu dropping and the landmines game, which have nothing to do with Pagestream. My understanding is that Calamus uses custom screen i/o routines and goes around the VDI. Which points out my thinko visible above. AES probably needs work too, but it was VDI slowness I actually saw.

My gripe with Pagestream has always been the wait before the redraw (rendering speed), not the redraw itself. And the Falcon030 helps a lot there.

6472. MiNT1.04 memory problem (?)

Newsgroup: comp.sys.atari.st
Date: 1993-05-04 14:11:54 UTC
From: thiele@quando.quantum.de
Message-ID: <1993May4.141154.9474@quando.quantum.de>
Source record: 206354

Hello everybody,

I have some weird problems with MiNT1.04. I have compiled it with
GCC2.3.3 and MiNTlib30 on a 4MB Mega (Tos1.2). It works fine, also
with TOSWIN.ACC (1.4). But when I boot the computer with XCONTROL.ACC
(and TOSWIN), the computer crashes after the AES draws the window
border but before XCONTROL can draw his part.
But when I change the physical order of the accessories (that means
the order of loading while booting), XCONTROL works fine, but then
TOSWIN won't work!!
It seems to be a memory problem. When I compile MiNT using the 8K-
bounding for memory allocation rather than the 256 Byte (normal for machines
without memory prot.), than it works fine with all ACC's (but I waste
memory of course).

Maybe someone has solved this problem. The 8K-Bounding wastes a lot of
money, but digging into MiNT's source code to locate the problem is very
difficult.

Thanks in advance

Holger

The best program I've seen for converting sound files, is SOX
though written for U*ix, it should port easily. I'm not sure of an ST
one. Sorry can't help with a player, perhaps play20 (?) in Sounds at
atari.archive might handle something similar. Sorry i'm not big on
sound with an ST.

>Turn off OPTION BASE 1 (use temporarily OPTION BASE 0) and then edit your
>FOR...NEXT loop to be
> FOR i%=0 to totalcount

>That'll fix it. GFA *needs* menu(0)!

OPTION BASE 1 will not cause GFA's internal MENU() array to
become 1-based. In fact, MENU m$() will work if m$() is an 1-
based array, but MENU(0), which should contain the index of the
string that was selected will be one too low in that case, i.e.
if you want to print the selected string, you must use PRINT
m$(SUCC(MENU(0))) if m$() is an 1-based array.
Other than that, GFA can handle menus based on 1-based arrays. I
don't know for sure, though, as I always use 0-based arrays. In
general, I think using OPTION BASE 1 is not a good idea -- it
will slow down the program, plus it can cause weird effects, as
it's one of the trouble statements that sometimes trigger
compiler bugs.

6475. Incorporating Easy Draw II diagrams into First Word Plus

Newsgroup: comp.sys.atari.st
Date: 1993-05-04 14:50:20 UTC
From: chas@castle.ed.ac.uk
Message-ID: <35210@castle.ed.ac.uk>
Source record: 206353

This is posted for someone without newsgroup access; he is using Easy Draw II for creating diagrams, then printing them through First Word Plus, as part of a document. When he prints Easy Draw II diagrams directly, they come out fine. When he does it through First Word Plus, they come out double-sized, dotty, and virtually illegible. Any help will be 'received with joy'. Reply in the first place to this mail address (chas@castle.ed.ac.uk).

as spake by sjg@phlim.ph.kcl.ac.uk (Simon Gornall) :

>} [...] These 8 disks give you a complete TeX/MF working environment
>} with a GEM shell. [...]

>Doesn't work under MiNT though [...]

Which, TeX or just the GEM wrapper? I've used both under MiNT 0.95 with
no problems. Granted, I only use the GEM shell for building fonts or
format files, but it still works.

> [...] - I was thinking of incorporating a TeX
>subset for the MDK, but there's not much point if the shell don't work.

Why? A few judicious aliases in your favorite command-line shell should
do the trick just fine.

I think the latest version of the Spectre is 3.0 (I'm still running
2.65 - if I ever get around to sending in the upgrade fee :-)

I believe you can safely run System 6.0.7 or 6.0.8 on Spectre (at
least the later versions)... (no System 7 however...)

The current release version is GCC 2.3.3. Get the file gcc233b.zoo from the
archive and read the Readme file contained therein. That will tell you what
other files you need. I have posted that file to this newsgroup before, but
rather than repost it this time around, I'm just telling you that it's there.

As for all those Update files - all the updates have already been applied to
the packaged files on the archive. The updates are being archived separately
as a convenience for those folks who already have a working GCC installation
and don't need to transfer the entire distribution anew.

If you have only 1 meg of memory, MiNT really won't do you much good...

>Anyway, could someone post a binary to comp.binaries.atari.st, or
>upload to anon. ftp somewhere ??

Please re-read the "copying" file that came with MiNT 1.04, and you'll
see why this hasn't been done.

If you really, really want to try MiNT (like I said, it really isn't much
good in 1 meg of memory), then wait for MiNT 1.06. It should compile more
easily with Lattice, and will be released "soon" (in a week or two, I
think).

Well, if we talk about the old ST, remember that machine lacked
a graphics coprocessor, disk i/o dma, sound dma among other things.
Still the machine would be slow.

At least speaking for myself, I usually pop in when I see an ujustified slam toward the Amiga (either misinformation or lies) or something which isn't true.

Anyway, this sinclair guy I think he wants to bash for just for bashing 'cause he also does the same on the amiga group. I think he might be related to MB somehow because it seems he also comes form IOWA.

Atari ST *** G A M E S *** for Sale!

The following software is for sale:

Populous Puffy's Saga
SimCity Arkanoid
Oids Ranarama
Dungeon Master Gold of the Americas
Chaos Strikes Back
Balance of Power

All Atari ST games.
First column $5, Second column $2.50
Buy two from the first, get one off the second for free!
Make me an offer for all of them!

Other software:

WordPerfect for the Atari ST (no Documentation) : $10.00
Mark Williams C - C compiler for the Atari ST : $20.00
Includes: Version 3.0, C Source Debugger,
Documentation & Atari ST Internals

6495. Atari TT as prize on game show.

Newsgroup: comp.sys.atari.st
Date: 1993-05-05 01:09:23 UTC
From: rdt154k@monu6.cc.monash.edu.au
Message-ID: <1993May5.010923.13479@monu6.cc.monash.edu.au>
Source record: 206450

Saw the most unbelievable thing last night (04/MAY/93). An Atari TT
was one of the major prizes on 'Sale of the Century' (sp), a quiz
show here in Australia. It came supplied with some bundled software,
unsure of what exactly. The quoted prize value was $2900.00(AUS).

Could Atari Australia be actually doing some covert advertising. Who
knows. Before i forget, it included a 14in colour monitor ????.

Now onto another topic. Can anyone please help me, i wish to purchase,
(yes, depart with some of hard cash), TOS2.06 roms. Where in Australia
can i buy some from. No i do not want a kit which includes an adapter
board, just the roms. Any help would be appreciated.

Thanks in advance.

6497. WANTED: Hardware virtual desktop for TT (like MonSTEr?)

Newsgroup: comp.sys.atari.st
Date: 1993-05-05 01:52:10 UTC
From: warwick@cs.uq.oz.au
Message-ID: <13238@uqcspe.cs.uq.oz.au>
Source record: 206377

I'm looking for a hardware-scrolling virtual desktop that will work in
the TT's graphics modes.

Alternatively, anyone who has written something like this (but for the STe),
tell me the necessary information and I'll write it.

Also, I wonder: do any of these virtual desktop programs work with Warp9
or NVDI? I'm actually suprised that such programs DON'T have virtual
desktops built-in.

6498. Re: Spectre 128 Versions??

Newsgroup: comp.sys.atari.st
Date: 1993-05-05 02:05:09 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93124.68709.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 206379

To partially answer your questions - the latest version of Spectre GCR current-
ly available is version 3.0. The manual states that Mac System/Finder 6.0.4
and 6.0.5 work OK, although some people claim that 6.0.8 work OK (but I
wouldn't recommend it unless you've tried it with whatever application you
are going to use. As for support by Gadgets by Small, I've said it before
and I'll say it again. . . there ain't none! Your calls will go unanswered
as will your faxes and E-mail postings. I haven't seen anything new on
GEnie from Spectre in a long time. Somebody called my house and left me a
message on my answering machine (he probably read one of my complaints about
Gadgets on this board), and left a message informing me that in some magazine
called "ST Informer", there is an article explaining why Dave Small has dropped
out of sight. Sorry, but I don't get "ST lnformer", so I didn't see it. I
think he said it was in the March, 1993 issue. So, if you can use Spectre
OK without much support, go for it. But be aware that you will be on your
own. I don't know how much Spectre and ROMS are nowadays (I paid $500 total),
but today you can get an awfully nice used Mac for that price, probably System
7 compatible. Think about it before you buy. I know the old Atari is hard to
let go of, but a time comes when we Atari die-hards have to face the facts.
Things aren't going too well for the Company and the developers who support it.

What is the latest version of the Spectre software? The last one I knew
about was 1.9F. Is the Spectre GCR still being supported? I haven't heard
anything lately and have been out of the ST arena for about a year and a
half. Also, what versions of Mac OS/finder being used (last one I ran was
system 6.02/finder 6.1)?

Thanks for any help you can give me.

>Only worrying point; Falcon seemed to be pushed as a souped-up ST rather than
>as a seperate, new computer.

I think the reason for this should be pretty clear. You've actually given
it yourself:

The Atari ST is very familiar to music people, and very popular, so it is
only logical to sell the Falcon as "everything the ST is, plus DSP, D2D,
16bit sound, 8 channels, VGA, etc".

Well the hardware-scrolling virtual screen I use is called MonSTEr ( Dont know if
it likes TT's though ) and it can do about 1280x960 i think, damn smooth too.

Yes, Warp9 at least I know to work with this as I use it all the time with no
problems at all. Can't speak for NVDI though, just bought it but haven't tried
it with MonSTEr yet...

Sorry if this has been asked about 6,000 times or more, but I just discovered this group a while ago... Anyway...

I was wondering if it is possible to get a "relatively accurate" shell set up for the ST. I prefer -csh, but anything would do okay. Just want to experiment for now... I'll worry about getting serious a bit later on.

Please conserve bandwidth (if this is an FAQ), and go ahead and e-mail me at "thomas@lcc.edu" or here.

Thanks a lot!

>Has anyone out there got some confirmed pricing (Retail/Wholesale)
>of the Falcons? (Mainly the 4/65 and 16/65 units!)

Here are the prices for a local dealer. As far as I know they are MSRP.

RAM/HDD

1/0 $799
4/0 $999
4/65 $1299
14/0 $N/A
14/65 $1899

On the 14/0, I guess you just have to get a 1/0 and upgrade it... Though
personally, I hope they do not sell less then a 4/0...

- ] Look, it's a different design philosophy. Connect decides to use GEM and
- ] windows. That's one way to go, and has certain advantages. A disadvantage
- ] that you'll NEVER get a full screen window with an 8x8 font. Can't be don
- ] med res. You're railing against limitations of your system, and pegging
- ] Connect as the culprit. This is wrong.
-
- Unless you use overscan (hardware or software 'emulators')
-
- The biggest problem I have with Connect is that it does use GEM windows
- which makes screen updating quite sluggish!
- (Stick Warp-9 on and it improves, but still not as fast as say a plain
- full-screen terminal, GEM trying to keep up with 19.2K text
- on the screen is laughable!)
```

Actually, CoNnect can keep up fine with my 14.4K modem. If dt uses a smart output method, unlike other GEM terminal programs. If 2K of text suddenly materializes in the buffer, CoNnect will doa block output to put it all on the screen at one time. Other GEM terminals seem to put every character to to the screen, one character at a time.

Regards,

You can use '525' to convert au and snd (and many other formats) to
many different formats (including the raw format of most ST samplers).
525 is a brand new program with a very nice user interface (that even
works with MultiTOS).

It's available at a.a.u.e.

It could also be mentioned that the distribution kit contains all necessary files for getting GCC up and running, even though you are not necessarily getting the absolute latest versions.

I really can recommend the distribution kit if you are not all on the inside with all the strange and mysterious packages that makes a unix(-like) system. The distribution kit automates the process and gives you a ready-to-run environment, and a great way to keep a backup of your setup in case your harddisc gets corrupted during the first period of raving around in the candy shop (happened to me a couple of times!).

Whoa there! Time out! The ST is good at many things, but even the
most faithful ST owner would not say the ST's sound is good.

Good sampled sound takes bags of raster time on the ST, so
there is no point using it.

>the screen, one character at a time.

The other thing to consider is that if you have more than one
window open, Connect tasks between the windows, which would make
the display seem either slower or less smooth. I haven't tried
just 1 window (I usually have 3 available, depending if I'm modeming
or null modeming) so I might have to verify this though later...

On the subject of tasking, try opening 2 windows with the same
port and settings - if I remember right, Connect will task between
the two windows - and split the characters between the windows equitably :-)

I've done 19.2k (or 38.4k, I have yet to totally get those
bloody high speed modems configured to what I want :-) but the
information displays at a good rate, albeit not smoothly
("jump" mode)...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...come to think of it, there is one other reason I have multiple
windows open - one is set at "no scrollbar" to display the whole
"screen" on the screen in Mono (which I normally use when I'm
dialed into a unix box like this) and the other is set with scrollbars,
so I can look back at things (particularly useful on GEnie, like
in the download areas)...

Source code to such a beast is available via anonymous ftp on
watserv1.waterloo.edu, in /languages/p2c or possibly
/languages/pascal/p2c.

If you've got access to a Unix box of some sort, you may wish to run
p2c there. I made a preliminary attempt to port it to the ST, and was
just running out of memory resources continually. And if it had
worked, it would have taken probably a good 8 hours to get the thing
compiled. Better to stick it on a Sun.

6522. Infocom ZIL Interpreters

Newsgroup: comp.sys.atari.st
Date: 1993-05-05 13:00:37 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1993May5.130037.25096@csi.uottawa.ca>
Source record: 206405

Does anybody remember the old Infocom adventures?

Has anyone turned green with envy at the fact that Activision has released them in two packages, called "The Lost Treasures of Infocom I & II"? Available on IBM and Mac only?

Well, there now may be an answer for the Atari users.

Infocom adventures were produced in two pieces.

Firstly, there was a data file containing the game vocabulary, rules concerning how commands worked, objects, locations, descriptions, and all that sort of stuff. All of this was placed in a file called STORY.DAT.

The second piece was the program that you'd run, containing an interpreter for the story database. Internally, it was called ZIL, standing for the Zork Interpreted Language.

What's really interesting is the fact that:
a) The same version of STORY.DAT was used for each different computer.

b) The same version of the program could be used with different STORY.DAT databases if one wished to run different adventures.

In short, everything was written in an extremely portable way. This is how Infocom was able to so easily support having umpteen different platforms. Each STORY.DAT got written once, a ZIL interpreter was written for each platform, and thus in order to have N games on M platforms, only N+M "programs" needed to be written, but resulted in the availability of N*M different "product versions".

So far this is all rather academic. Well, actually it maybe isn't :-).

If you as an ST user wants to run Infocom games, and use the Lost Treasures at their fairly impressive pricing (~$70 for about 25 games) you can do one of four things:

a) Buy an IBM. I don't think so.

b) If you have an ST version of one Infocom game, then you have a copy of ZIL. It's probably capable of loading in most of the other Infocom games; all you need do is to toss it in the same directory as the sundry STORY files, and just run 'em.

Actually a fairly simple answer.

Then comes c) and d)

c) Download pinfocom.zoo from atari.archive.umich.edu (it's there;
should head to /atari/Newitems Real Son Now).

This contains C source code and Atari binaries to a portable ZIL
interpreter.

I've linked into this a line editor called "editline" (largely
compatible with GNU readline, but considerably simpler) which makes it
work a little better than the original ZIL interpreters. Anyone
interested in hacking on it should search for "readline" in the
sources; that will indicate the most questionable parts of the code.

d) Download zmachine.zoo from atari.archive.umich.edu (it's there;
should head to /atari/Newitems Real Son Now).

This contains source code and binaries to another portable ZIL
interpreter.

There is also a ZIL interpreter called the InfoTaskforce ZIL
Interpreter. It is probably better than either of the preceding two;
unfortunately, it seems to use curses features that aren't in the
official curses libraries, and I haven't gotten it to compile.

|> details.
|>
|> Erlend.

Oh no!

The .pfm and .afm files contain *only* metric information, you may
convert them to .tfm to use the fonts with TeX (and dvips).

You need .pfa or .pfb files, BOTH work with ghostscript, but
never edit a .pfb file, it won't work! (That was my mistake)

BTW: ghostscript is graet especially with some new fonts (reall Type 1, not
converted bitmap)

Axel Kielhorn

PS: Of course i will stick to TeX for every day use, but on the weekends \dots

I realize this group tends to avoid Game stuff, but I just tried Microprose Golf and I am unbelievably impressed! This is one of the best quality 'games' I have ever seen! Game is definitely an injustice, this is a true simulation...although the fact you can install it on an Amiga hard-drive and not an ST is annoying! The graphics are amazing...you can actually read the greens without the need for those annoying indicators...amazing! For anyone who has played other golf games it won't take you long to lower your handicap...but to lower it all the way to scratch is a challenge I look forward to! After getting bored with the lack of variety of f-19 missions, this game has put Microprose back in my good books! Try this game...expensive, but WELL worth it...FORE!

Hi folks,

I am interested in any experiences you have made with a STacy. I consider buying one because I'd like to have an Atari which I can carry around to give demos of my programs. So I need to know, how well does it work? Does it run MiNT/MTOS? Which are drawbacks and which are its good sides, in your opinion?
Finally, I'm interested whether there are any used STacys available in the U.S., and what you consider to be a reasonable price for them.

Source record: 206414

The Atari ST is probably the best platform for Classic games. Atari
themselves released many of the Classics for the ST:

Robotron 2084
Joust (better graphics than the arcade!!)
Battlezone (lame)
Tempest
Qix
MoonPatrol
Millipede (great! w/better gfx)
Missile Command
and others I cannot recall at the moment....

Llamatron is an excellent Robotron improvement!
Register Llamatron and get Andes Attack: Defender clone also by Jay Miner
Defender II is another defender game by Jay Miner w/
Defender/Stargate/Defender II
Anarchy is a Defender clone by Psygnosis that uses the STe features also
(better gfx and sound)
and the last Defender clone I'm aware of (of any merit anyway) was part of
a European demo (British I think..) and was supposedly the best version of
Defender ever made... I read about it in ST Format... It supposedly used
the STe features to the max... If anyone has any info on this one, please
post it or e-mail me...
Oh, btw, there is a demo of Defender II on archive.umich.edu...

All of the commercial classics are cheap when you can find them...
Llamatron and many others not listed by me are shareware/freeware...
The others I listed are not...

hope this helps your decision on getting an ST..

OK, so I was a little off on my bankruptcy prediction, but I have
been quite accurate with the stock price and financial results.
Frankly, I'm amazed that the Tramiels continue to pour their
money down the drain. It doesn't make any sense...

> DRI has been gone for about a year now. The pieces belong to Novell, who

You are right about DRI. GEM 3, however, is still available. There are
a few diehard users who swear by it at my bank. Go figger....

Cheers,

Chris

>
> Good sampled sound takes bags of raster time on the ST, so
> there is no point using it.

I agree that the sound quality leaves something to be desired, but it's certainly not infeasible to use sampled sounds in speed-intensive applications. Many games use them, even shareware ones. Examples: Llamatron has (I think) 5kHz samples, HacMan II has between 4kHz and 11kHz samples, and Blox has 11 kHz samples. Even 8kHz samples are pretty convinving if they're clean.

For games, sampled sounds are really the way to go -- they sound much better than synthesized equivalents and they're easily portable to other platforms.

Great. :-(I asked Bob Brodie personally at the Chicago show last year (or
was it two years ago?) about a postscript driver for FSM-GDOS, and he said
that there would be one. Well, now that FSM-GDOS will not see the light of
day, I can't believe that they would not include a PS driver with
Speedo.

I found a small program called BIGSCREEN (bigscrn.arc) in an a.a.u.e mirror
a couple of weeks back. It worked on my ST, but I don't know whether or
not it would work in the TT modes ...

>Alternatively, anyone who has written something like this (but for the STe),
>tell me the necessary information and I'll write it.

Erk ... sorry ...

>Also, I wonder: do any of these virtual desktop programs work with Warp9
>or NVDI? I'm actually suprised that such programs DON'T have virtual
>desktops built-in.

I was using NVDI when I tried bigscrn. Indeed, on an ordinary ST, I think
you would need it for horizontal scrolling (that is'nt hardware).

As for building it into an accelerator, I found it a bit awkward to use.
Practically all dialog boxes call form_center() before they are drawn,
and on a virtual screen, this means they are placed in the middle of
the VIRTUAL screen, not the PHYSICAL one ... downer !!

Still, I suppose that is not much of a problem !! NVDI could always be
told to switch it off !!

Also, some GEM applications (the naughty,cheaty ones) don't understand
the virtual screen AT ALL .... big downer ...

Dave.

Hi John, how about spilling some beans about Atari since you've gone separate ways? This group could use some actual facts about the health and status of the company instead of wild rumours. I don't mean to suggest attacks on Atari officials or anything, just some facts about how the Falcon is being handled, what their prospects are, etc.

I can't say for sure about an ST, but on a (Mega)STe, the sound is quite good (and no speed degredation, even with MOD files).

> Good sampled sound takes bags of raster time on the ST, so
> there is no point using it.

Since the ST doesn't use DMA sound (correct?) then I'd imagine it would take up CPU time. The STe/TT/Falcon should have no problems using sound however (digitized in particular). The game "Blat" shows a good example of this...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...besides, compared to the speaker in my 386 at work (no-soundblaster) STe sound is a whole different world :-)

I checked the Hardware FAQ and could not find this information: what speeds of SIMM are 'safe' for ST use? I seem to remember a thread about SIMM's faster than a certain speed were not usable...was it 90ns or 70ns? Also, can I use 9bit SIMM's on an ST? Perhaps this could be included in the next FAQ under the mention of SIMM's...perhaps also the many SIMM conversion stuff (so older ST's can use SIMM's) can be mentioned...they're great!

How about ... NOT!

I just tried to replace my TT (my old one got stolen) and it was
nearly impossible to find a TT, let alone find it all that cheaply. In
fact I had to buy an 18MB version because that was the only shop in the US
that even had one to sell (ok, so he didn't have to break my arm or anything
to get the 18MB...it was just ... a bit more than I expected).

This is rediculous that they would say that there is "no interest" in
the TT when just about EVERY Atari store is out of them (or they refuse to
sell their showroom model).

Now if this was because they are coming out with a new product that is
comparable in utility and speed to the TT (and the Falcon is not - even by
their own admission, the Falcon is a "low end machine and if you want better
performance buy the TT" <ok so its not a quote - merely an interpretation of
every response to the question of "how fast is the Falcon?">). Hopefully this
is heralding the introduction of at least a 32MHz version with a bus speed
that can handle both the video load and the CPU (I still like the idea of a
"split bus" where video is a separate bus from prog/data such as on the TT).

Are you talking about absolute sound quality (i.e. the stuff discussed
in high-end audio circles) or sound from a game player's point of view?

(I love "dragon bite" sound in 2600 Adventure, for example, but the
2600 sound system isn't "good" by anyone's standards.)

From: azog@world.std.com
Message-ID: <C6KJtG.5C1@world.std.com>
Source record: 206430

Ok, this is a definate repeated question, but Ill ask anyways.

I have a DEC VR290 19" colour monitor, and am toying with the
idea of attaching it to my ST.

Here is what I know for sure about the monitor. Its a 60Hz refresh
rate, which is the same as the SC1224. Also, it supports a rez of
1024*864, which is close enough to 1024*768 not to matter. Sounds
pretty 'standard'.

An unknown is that the monitor has three coax jacks, one for each
colour. I think that sync is only supplied on the red, but this
doesnt sound right to me, I thought sync would be on all colours.

Oh, its also non-interlaced, of course!

Any hints, ideas? Thanx

Okay, I've jus managed to get all the parts, and opened up my STFM
to install the overscan, and then found out that the parts shown in
the diagrams, don't seem to exist!

The diagrams are for a revision F STM motherboard, I have a revision
D STFM motherboard.

Will the overscan go into a machine with a Rev' D, STFM board? If so,
is the 'modulator' the RF-Modulator? In which case, where on earth are
the pins for it, as the thing is encased inside a metal box, and then has
a small board soldered below that....

I also can't seem to locate the appropriate chips & resistors etc.
(It says there is a L26 resistor to the right of an MFP 68901 chip, which
doesn't exist on this board (none have that serial # printed on it),
and further to the right is a C16-resistor, which is beside the MMU (which
I'm not sure of which-chip it is anyway, as the only square chips (the
MMU in the pic' is square, not rectangle), are 2 near the bottom of
the board (One I presume is the processor).

Can anyone out there give me any help at all? As 640*200 is getting
me down! :)

Anyone successfully put O-scan into an STFM? How & Where!?

E-Mail replies would probably be best to save bandwidth!

You see strange things when snooping around strange newsbases.

I was over in rec.video.games.misc, and, since there were over 2000 messages, I caught up. Going back about two hours later, I noticed a message pertaining to the wonderful Lynx. Being the curious type, I was patient enough (aka, I went and did something else) while my newsreader read all 2000 messages.

My diligence was worth it. The Lynx 900 number is up (not good for us, but, hey, there _are_ alot of people out there how can't get on the net,) Lemmings is out, so is Gordo 106 (!?!?!?). Also, Battlewheels just hit the stands, with up to six Com-Lynx'ed together for a bit of Mad Max on steroids.

The kicker? Wolfenstein 3D in production.

Boy, wouldn't it be strange if Atari pulled another one of their "Back from the Dead" turnarounds?

Just a thought.

Why don't you ask in comp.sys.AMIGA.emulations?
Now for my question.
Can a 520 ST be expanded over 1 MB? I would think so, since the 68000 can address over 1 meg. Also, can the ST's use a more advanced 680x0chip? Will it work with a multiscanning monitor? If I find a used one in the paper I'm tempted to buy it. I'm bored with my present machine.

No, Cubase works fine, although there are problems with the MIDEX.
Notator won't work at all, but that's no surprise as is doesn't work
on TT and other graphics expansions for the ST.

This is ridiculous, The AmigaDOS OFS format is one of the most secure formats in
existance.

On a related note, Why do ST's waste 160K per DD disk? I mean, 9 sectors per
track, how outdated can you be?

Ummm, maybe because, although the blitter is pretty good, it can't do THAT much about the speed of the disk drive? (For those that don't know, the Mac has (had?) a variable-speed disk drive, something like that used for CDs...)

Robert Brown.

As a matter of fact, in my mail today I received a mailing from Atari about the Lynx - including a 1-800 number for ordering the Lynx, its games and accessories, as well as a "buy 2 get 1 free" offer (there were about 40 games listed in the offer). It's not quite a spot on the final episode of Cheers, but at least Atari's beginning to do some advertising again :-)

>Boy, wouldn't it be strange if Atari pulled another one of their "Back from
>the Dead" turnarounds?

I think that is their company premise (they should've called themselves "Phoenix" instead of Atari - as they have that knack of coming up out of the ashes :-)

6562. color emulation on mono monitor?

Newsgroup: comp.sys.atari.st
Date: 1993-05-05 23:39:40 UTC
From: braner@trantor.emba.uvm.edu
Message-ID: <1993May5.233940.17071@uvm.edu>
Source record: 206446

I have a 5-year-old son and am looking for educational ST software for him. What I have found is mostly limited to lo-rez color, and I only have a mono monitor. There are several emulators on atari.archive.umich but I have had no luck with them. One is described as crappy right in the index. One is claimed good, but in lo-res it uses either half screen width or half of both dimensions, and in only 3 or 2 "colors" respectively. (That's called EMUMONTR.) COLOREMU refuses to run at all on my machine. BIGCOLOR could be nice (full screen and more shades) but I only got it to boot a couple of times, usually it loops through the booting process endlessly. EMULA.LZH is mentioned in the index but is claimed not to exist by BART. What's going on? Is there a solution? Ideally I would also like a RAMdisk to coexist with an emulator, and survive rez changes. My hardware: 1040ST upgraded to 2.5 megs, one floppy drive. Thanks for advice.

Yea, but Atari does not have the capability to mass produce the Falcon...The
Amiga will have DSP later this year and I bet that the installed base of DSP
Amigas will be higher than the Falcon base...C= will mass produced them in the
hundreds of thousands...

>

Yes, an accessory can do whatever it wants in the background. There are
however some complications to do with memory allocation and extra care
has to be taken with disk access clashes with the main application.
There is even a DA that converts First WOrd docs to ASCII in the
background.
The OS places no limits on what an accessory can (except the above).
One thing an acc can never do is run a program. But the Gemini desktop
gets around that one.

] who has played other golf games it won't take you long to lower your

It's a VERY good game, but far too easy. I am utterly hopeless at normal golf, but manage to hit the ball in this game for the maximum distance (250-feet I think), quite easily with the driver. All you need to do is hit the power, and then hit the button at just the right moment to put it where you want to go, and anyone with half-decent reflexes can very easilly hit over 150-feet!

But, it is BY FAR the best golf-game on the ST! (I've seen Leaderboard and a few others, all either too complex, or just no good!)

] Whoa there! Time out! The ST is good at many things, but even the
] most faithful ST owner would not say the ST's sound is good.
```

The good ole' STE can play 25-Khz Samples and still do other things quite happily!

The game 'Lethal Xcess' had pretty good in-game music! And brilliant intro' music!

Sound-chip sound is pretty pathetic, but I've still heard some very good efforts from it!

sigh Well, my well used Atari Portfolio apparently bit the dust. The display goes nuts after a few keystrokes, then goes blank. I reset the computer, even removed the batteries for a few days to totally clear memory, and *poof*. It no go.

So, does Atari still have their repair/replacement policy? (Ship the Portfolio to Atari with a check for $xxx and Atari replaces it) Or can someone recommend a place to get it fixed? B&C Computervisions in Santa Clara? That place in Texas that does memory expansions and hard drives???

Although I'll be getting a Psion anyway (won it in a contest) I still would like to have a working Portfolio. (I ended up collecting Ataris, this is my fifth one, *sniff* the only one that doesn't work)

6580. Q: GEM speed on Falcons

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 08:03:35 UTC
From: martinmf@imv.aau.dk
Message-ID: <martinmf-060593104914@ydun.imv.aau.dk>
Source record: 206318

Yesterday I tested the Falcon with the "GEM test" programme and found, that running in ST High-res, the GEM routines were quite a bit faster that on the ST. However, using the 256-colour mode under MultiTOS, GEM routines were slower. Down to 24% of normal ST speed.

You can actually see this when using the Falcon. Under MultiTOS, the drop-down menus are delayed - the don't drop down instantly. Why?

And another question: Is it possible for anyone to write a program, that will make the mega-size scrollbars smaller? They have apparently grown several pixels with the introduction of 3D-buttons and sliders.

6581. upgrading a megafile 20

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 08:12:06 UTC
From: richard whitehouse <richard.whitehouse@canrem.com>
Message-ID: <1993May6.4514.33144@dosgate>
Source record: 206290

Hi, all;

I'm wondering if anyone out there has experience doing what I plan to do: namely, exchange the Seagate ST225 MFM drive mechanism in my Atari Megafile 20 hard drive with a larger MFM mechanism, perhaps 40 or even 80 megger if I can find one.

I don't know a heck of a lot about hard drives in the first place (not a techie), but I've done some researching about what options are available to me regarding upgrading my hard drive situation (I have an old Mega 2). These options seem to be: an internal SCSI with an ICD host adaptor, or an external drive with an ICD host adaptor, replacing the drive mechanism in my Megafile 20, or just plain buying another used external hard drive.

Upgrading the drive mechanism seems like the cheapest and smartest way to go, but I want to know exactly what I'm doing. I've had trouble finding anyone who has empirical experience doing this.

Thanks for any help, Richard.

Er, I think you mean yards, not feet! I've got down to scratch, and have
beat the first of the computer challengers. There are seven more to go, but
I have got nowhere near beating the second challenger. Steve was right, it
is a real bastard that you can't install on the hard drive. Just to take
the mick out of us, Microprose included an update on how to do an Amiga
installation.

And no program I have understands the floppy format, so backing up the
data disk is pretty difficult...

There is a new commercial version of Bigscreen called Bigscren2. Here you can get the information which part of the screen is actually shown.
Let'em fly uses this information. You will get your boxes centered in the physical screen.

>grab the diffs from CIX (I don't think I have them in the office anymore...)

For a start I haven't a clue (or the money --- if there's a bill involved)
when it comes to BIX/CIX/...etc.

I had to start adding CSECT commands in the assembly stuff and the C source
itself was RIDDLED with errors (due to my compiler completely ... I have been
assures by most of the world that it does compile ...).

Even though I can switch off the ANSI-compatibility for Lattice ... it still
HATES the function structure a la K&R:

```
int main(argc,argv)
int argc;
char **argv;
{
...
}
```

And that sort of thing ... I also can't get it used to the K&R standard
`extern' type stuff ... it seems to still want to use SOME ansi type rules
here.

The last thing is MAKE .... I can't get it to work !!!!!

[SMALL PROVISO: I do have a copy of GNUmake, but due to the startling
juxtaposition of this week and my exams (aarrrgghh !),
I have had no time to experiment ... will GNUmake work
with Lattice ... ???]

As for the patches ... I could implement them here (SUN Sparc) and download
the patched source to the atari ... I don't have `patch' at home ...

Yes, you can run shells on an ST. For a long time, I used the Gemini desktop
(shareware from Germany), which has a shell called Mupfel. You can run
Mupfel directly from the desktop. If your ST doesn't have TOS 2.06, Gemini
also gives a much improved desktop.

A more complex solution would be to use MiNT, Toswin and one of the shells
ported for the MiNT environment. Bash, ksh and tcsh at least have been ported.
As MiNT is a multitasking kernel, you would get the ability to run multiple
tasks too.

Also available are unix-type editors - vi, emacs and many unix utilities - grep,
sed, awk, etc. Most were probably compiled for MiNT, but I would imagine would
also run under Mupfel.

If you are going to use Gemini/Mupfel, I would recommend 1 meg of memory,
although you might get away with 512k with just Mupfel. For MiNT, I would
recommend at least 2 megs, because as soon as you start trying to run multiple
tasks, memory is just gobbled up!

I can only confirm further to this - the Cicero section in the German mag ST Magazine (this section is made by the Calamus people if I'm not mistaken) has mentioned it and while on CeBIT I saw Olivetti people around the DMC stand. Apparently this thing will be seen on an Olivetti RISC box. Although I'm no fan of NT (or Windoze), I'm just glad that I might see a more structured version appear. Wanna see something ugly? Go see the interface of Calamus... (No I don't mean the toolbox, I mean everything else...)

Well I suppose what you consider expensive is pretty subjective, and if WP.PRG does what you want better than anything else that's fair enough. However, in the context of Wordplus to postscript, RTF and LaTeX converters which are all PD, US$20 seems pretty steep to me, especially as you e-mail it uuencoded - not much of a post and packing overhead.

>What would you consider a reasonable price?

So, perhaps its beautifully presented, works perfectly (though not on graphics) and I realise you needed to buy the Wordperfect developer's kit for it, it still doesn't do an awful lot - in the case of the original question I'd try 1WP2RTF first, and if that didn't work put the $20 towards Redacteur 3 instead ($60). Each to his own.

Follow-ups by e-mail ?

That's all there is. There are no other Falcons.

I promise I've been trying hard to ignore them ever since I read this group for the first time... sorry that I couldn't calm down and had to explode.
You know, I don't think this guys are amiga/mac/... fanatics, if they were they would concentrate in their beloved computer. I AM an Atari fanatic and don't go bothering everyone who has a different computer to mine, theirs has to be a deeper problem... maybe they have an inferiority complex, or are not sure if they did a good purchase and so they have to reasure themselves by telling all the people how good their computer is... I can't understand it. You can find those kind of people in other common interest groups, too, mainly in groups whose interest rely in a more or less expensive object (cars, motorbikes, HiFi equipments, ...)

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I give in. Does anyone out there have a copy of the original ADHI disk ??

I am trying to re-format my SH204. I have tried ADHI 5 and AHDI 6, but
they insist that `This HD is incompatable with an Atari ST' and request
that I find another WINCAP file.

My original AHDI disk is knackered, and no amount of giggling with the
WINCAP file (from all versions of AHDI) will get it to recognise the
SH204 --- an atari hard drive !!

Could anyone that might be able to mail me a uue'd ORIGINAL ahdi disk,
please email/post ... or if you know a solution (eg. another formatter),
tell me (here or e-mail me)

If I can't get my hard disk re-formatted, I'll cry ...

Dave.

>There isn't going to be any high end Atari's...Maybe an Atari Power PC...

Well let me rephrase that: higher end Ataris. Of course there will be
more powerful Falcons. And that only if the Falcon succeeds of course as
a home-computer. People will always have different needs and the
current Falcon will not be able to provide everyone with enough
computing power. Of course most people will not need more, but some
will. For example developers could use more powerful machines and also
dtp-specialists and cad-users. To me this seems enough reason for
making at least 1 more powerful model.
An Atari Power PC...? Interesting. Well Taligent OS will of course work
on this machine if someone made this machine.

The price is indeed not steep, but what has kept me from buying this
utility is the fact that I do not use 1st word plus. A utility
converting between e.g. RTF and WP5.1 format would be much more useful.
Maybe something like the ppm/pbm suite would be possible then. With rtf
as an intermediate format. So: 1wp2rtf wwst2rtf twrt2rtf etc... and the
other way around.

Yeah this really is a superb game although my main concern is that its a bit too easy to play, considering I cannot play proper Golf to save my life I was a bit surprised when I got my handicap down to scratch and got 2nd place in the Head-2-Head championship... Even so this and F1 GP are two of the most playable and addivtive games I own. Recommended

Current falcons are all 1040 style Falcons. Considering the space on my desk I am not that unhappy about it. If you want desktop model. Buy a 1040 style now and sell it by the end of the year and get a desktop model then. However it was never confirmed that there will be desktop models by the end of the year, strong rumors have remained.

>were slower. Down to 24% of normal ST speed.

Well when at the Atari EXPO two weeks ago, I got a short demonstration
of Atari Works. Nice program, but in 256 color-mode screen drawing was
a bit like it is on my 1040 without blitter. So I asked what to do
about it (yep, asking for a solution to what one perceives as a problem
often gives one an answer). Let me first say that the man that
demonstrated this was very friendly and also admitted that
wordprocessing in 256 color mode was indeed a bit slow. So I said, will
switching to 16 colors help? And YES it works perfectly. Switching to 2
color mode makes the thing even faster at scrolling and formatting
text. Who need 256 colors anyway while doing wordprocessing.

>Where would I find MonSTEr? Does it only work with the STE, or would it do its
>thing on my Mega ST4?

I think you can find a copy of MonSTEr at atari.archive.umich.edu. It was
written by Darek Mihocka, and has also been included on the QuickST disks.
(I *think* Monster was released either shareware or freeware). Not sure
if it works on a standard ST or not (probably couldn't hurt to try)...

>What kinds of things does it work with? Things like Uniterm only, or tings
>like ConNect only, or graphics applications only, or what?

It should work with any program that is not locked to a specific
graphics resolution. For instance, programs like Connect, Gemview,
Word Writer ST, Calamus, Gemini, and other such programs should probably
take advantage of it. Programs like Uniterm will not take advantage of the
extra screen space (if I remember correctly, Uniterm will work under
it, but will only use the normal amount of screen space, leaving the
rest of the screen alone)...

>What is MonSTEr _intended_ to do, or to work with?

It's basically a scrolling virtual-desktop, giving you twice the
resolution in both vertical and horizontal (the screen looks the same,
but you can scroll into like "4 quadrants" of the screen, so to speak).
For instance, if you boot with MonSTer in ST LOW resolution, you'll
effectively have a "640x400x16" screen (though the entire resolution
won't be displayed at one time)...

Monster may make life easier, for instance, under a multitasking
environment - you could keep the different loaded programs in their
own screen space without as much (if any) screen overlap...

I'd be curious to know if it works on the TT or Falcon...

From: proche@imag.fr
Message-ID: <C6Lwvo.LDn@imag.fr>
Source record: 206338

Someone reported a bug happening on the city status of cities far from the capital, which resulted in a bus error. After debugging with MonST, I discovered that this bug occured in the routine darkenning the commercial revenues (which seems to be totally useless on ST), when the corruption losses are higher than the revenues themselves (which should be impossible). This seems to happen only in anarchy.
As Microprose doesn't seem to answer, you can prevent this thing in the following way:

In the file GAME.PRG, search for the sequence
4EB9 0005 737E 4FEF 0014 700D 3F00 (sector 176 of file GAME.PRG),
then replace 4EB9 0005 737E with 4E71 4E6E D03B

You can E-Mail me if you have any trouble.
One last thing about this game, I wonder if it is not easier to win on ST than on PC. After several easy victories, I never met a civilisation that was really developped (even on king level). Does anyone have the same sensation ?

Here follows a translated fragment from this month's article in ST Magazin,
a German ST magazine, on Calamus SL for Windows NT:

`DMC, the firm who produced the Calamus system, has been working on the
port of Calamus to the Windows NT platform since mid 1992'

`A version of Calamus had only to be taken seriously when it was able to
display characters. This stage has been achieved for Calamus NT'

`The main problem for the now completed port was that important pieces of
the code weren't written in a portable language, but in 68XXX assembler.
Such pieces had to be rewritten or extensively adjusted.'

`The port was done not by the people who wrote the TOS version, but by a
Danisch team, who had experience in the Windows-world'

`At the last CeBIT, Calamus NT was demonstrated on Olivetti's stand. The
system ran on a RISC Personal Computer M700-10 with a MIPS R4000PC CPU
running Windows NT. A version of Calamus NT for Intel processors is
currently under development. A version for the DEC Alpha processor will
come next.'

>> MultiTOS - Atari still makes computers?
>> --
JT>
JT> Anyone who would actually say that Windows "rulez" needs to have
JT> their head examined by a professional!

Come on, John, be a bit more realistic. Windows does `rule', well it probably is better to say `Microsoft rules', or even better `Microsoft is one of the most influencial firms in the computer industry today, like IBM was a few years ago'. I guess we all agree that Windows as a program isn't the most beautiful piece of program engineering (and that's an understatement ;-) but Microsoft has lots of influence, lots of money and know their marketing, something which Atari has never heard of.

It isn't that important if a product is good or not, if you can get people to believe that it is good and it is what they need, they'll buy it and the company will make some money out of it. Look at Microsoft with DOS and Windows on one side and look at NeXT and Atari on the other.

And by the time the Power PC's get into the shops, no matter how `good or bad' they'll be, (though I have the impression they'll be pretty good, looking at the bits of info which manage to get printed) a success they will become. Simply because large influencial firms who know their marketing and PR stand behind the project...

6612. Why can't I run anything on my Falcon?

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 14:44:11 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <C6M0xo.3rA@dcs.qmw.ac.uk>
Source record: 206341

Here's the set-up:

A Falcon (4/65) connected to a VGA monitor.

Quite straight-forward, yes? OK. I plug it into my MIDI gear, power up
Cubase 3.02 and it works (more or less) perfectly. Wonderful. The problems
start when I try to run just about anything else. The list so far goes like
this:

Mint/GCC - tried to install from the distrb kit of ftp @ umich
'setup' seemed to run through until asking for a
user name, etc., then it crashed. Tried all sorts of
resetting and re-running antics but to no avail.

CEBIT93 - 'I think ya need an RGB monitor (50Hz ya know)' message
when run on monitor or TV in any video mode (I think I tried
them all)

paragon2 - nice static piccy of a road - machine hangs. The graphics
certainly don't slow down with the sound running - they
aren't doing anything anyway

termfin(?) - TOS error 35, then GEM complains of having no memory until
I reset.

OK so that's not a huge list - but it bloody annoying. I've got this nice
new computer at home and so far only one (albeit very good) piece of
software to use on it. Admittedly I only bought the thing to run Cubase
anyway, but I want to know: what the hell am I doing wrong?

I have a few theories

a) I missed some vital piece of information somewhere along the line
b) I'm just plain stupid (very probable)
c) My machine hates me and is doing this just to annoy me
d) All the above software doesn't work at all and all of the messages I
think I read here every day are simply wild fantasies of a deranged
mind (probably mine, but not necessarily)
e) My ftp->Sun->386 PC (yuck)->Falcon routine that I use to download stuff
is cocking-up somewhere along the line
f) Hastily-programmed demo's won't work unless the Falcon used to run them
is correctly situated along a lay-line/in a crop-cirlce/under a pyramid/
within spitting distance of a recent UFO sighting/underneath a spreading
chestnut tree (probable - but doesn't explain Mint/GCC stuff)

These 'computer' things are just too much for me...

My ST can fromat from 360K to 1.66MB per floppy, depending on the
Tracks/Sector combinations... IBM can't read 'em all... ;)
However, most people will agree that the IBM is almost the standard in
disk format (I mean most programs/data are written on them!) WHY would
you want a different format unless you were planning on living under a
rock and not exploring the world! (My friend uses my ST to sector-edit
his IBM files and games).

Besides, one format makes life easier for Software Developers and
programmers alike.

|>
|> Chris Brown

Every once in a while we do swap information with people that own clones, and in that area you must have 9 sectors per 720k disk and 18 sectors per 1.44meg disk. But I normally format my disks with more than the standard number of sectors and tracks. This nicely provides security from an IBM user taking stuff snooping around my collection of disks at work. :)

I can read all of his 3.5" disks but the same is not true.

6615. The Unnkulian Unventures: Commerical Quality Text Adventures for FTP

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 15:19:48 UTC
From: dmb@case.ai.mit.edu
Message-ID: <1sbaakINN1i4@life.ai.mit.edu>
Source record: 206346
Cross-posted to: rec.games.int-fiction,rec.games.misc,comp.sys.mac.games,comp.sys.ibm.pc.games.adventure,comp.sys.atari.st,
comp.sys.dec,comp.sys.sun.misc,comp.sys.next.misc,comp.os.linux,rec.games.programmer

Special notes this time:

o Sorry if this gets posted twice. I sent it weeks ago and it seems
to have gotten lost, perhaps because I sent it to a few moderated
groups.

o I'm posting this to some new groups since the games run on
more Unix boxes now.

o The "lamp bug" in UU1 that made it impossible to continue the game
after a restore under some Unix implementations has been fixed.

o Games have been updated to TADS 2.1, and the Unix versions of the
TADS 2 compiler have been updated to 2.1 as well, with the exception
of the NeXT and DEC MIPS versions. We recommend that you get the
TADS 2.1 executables for your machine if you don't already have them.

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with
great puzzles and evocative descriptions without resorting to any
graphics at all? We really miss that emphasis on gameplay rather than
glitz, so we've decided to write our own adventure games along the
lines of the early text games we liked so much.

If you're looking for top-quality interactive fiction comparable to
1980's commercial offerings, check out the Unnkulian Unventure series,
available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of
Kuulest's slave, and must recover the Orb of Studosity from the evil
Unnkulians. Kuulest, the old geezebag, has died and left you with
nothing to go on but a cryptic message about saving the planet. You'll
encounter amazing Acme products, the infamous Guardian, those witty
creatures known as Drolls, a giant beaver, and even the Dread Unnkulian
Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure
continues as you try to create some good press for yourself -- wouldn't
want to fade into anonymous obscurity, now would you? Along the way,
you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?

o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

In _Unnkulia One-Half: The Salesman Triumphant_, you'll play the role of a down-and-out Acme salesman, forced to work out of the Golden Dragon Inn, dangerously near Dread Unnkulia. Will you accumulate enough loot in this frightful backwater berg to turn your fortunes in your favor?

And, in _Unnkulia Zero: The Search for Amanda_, will you, the Valley King's most trusted warrior, rescue his Lady Amanda from the gruesome clutches of the evil Unnkulians?

Along the way to victory (or, <shudder>, defeat!), you will:

o Find out about the ancient days of the Valley,
o Meet the King's faithful (but not so bright) Valley Patrol,
o Explore *beautiful* Lake Draounheer,
o Discover the ancient burial ground of your ancestors,
o Become frustrated with the pesky Stoll and his Stoll Bridge,

and, of course,

o Meet that wondrously wacky Wowsa Willy!

The Unnkulian Unventures have already gotten rave reviews from numerous adventure game connoisseurs around the world, so why not give them a try?

The games are available for FTP from the if-archive at ftp.gmd.de. (Note that the site wuarchive.wustl.edu keeps a mirror of the if-archive in the mirrors directory.)

PC and compatibles (running DOS):
---

if-archive/games/adventions/pc/unnk1v30.zip
if-archive/games/adventions/pc/unnk2v30.zip
if-archive/games/adventions/pc/unnkhz10.zip

Macintosh:
---

if-archive/games/adventions/mac/unnk1v30.sit.hqx
if-archive/games/adventions/mac/unnk2v30.sit.hqx
if-archive/games/adventions/mac/unnkhz10.sit.hqx

(These are Binhexed Stuffit 1.5.1 files.)

Others:

TADS now runs on lots of different systems. Because of this, we have TADS .GAM-file only archives that can be used with any

machine that runs TADS. The tricky bit is that before you can play the games, you need to get the TADS run-time for your machine.

Fortunately, this isn't hard to do. Just grab the TADS executable package for your machine from the if-archive:

Atari ST/TT/Falcon:

if-archive/programming/tads/atari.tads2exe.arc

Sun Sparcstation:

if-archive/programming/tads/sparc.tads2exe.tar.Z

Sun 3:

if-archive/programming/tads/sun3.tads2exe.tar.Z

DECstation (MIPS) running Ultrix:

if-archive/programming/tads/decmips.tads2exe.tar.Z

SGI (Iris/Indigo) running Irix:

if-archive/programming/tads/sgi-irix.tads2exe.tar.Z

Linux (386):

if-archive/programming/tads/linux.tads2exe.tar.Z

NeXT:

if-archive/programming/tads/NeXT.tads2exe.tar.Z

Amiga, other Unix:

In the works!

Once you have TADS running on your system, you can get the games:

if-archive/games/adventions/others/uu1v301.tar.Z
if-archive/games/adventions/others/uu2v30.tar.Z
if-archive/games/adventions/others/unnkhz10.tar.Z

The file How-To-Run-These-Games in the same directory gives your more information.

NOTE:

The source to TADS 2 is not distributable. However, if your machine isn't on the list yet, and you would like to volunteer to port TADS 2 to it, send email about it to Mike Roberts <mroberts@hinrg.starconn.com>. Porting to Unix-like systems is fairly trivial.

--

Unnkulian Unventures I and II are shareware ($10 registration fee each); registering gets you spiffy maps and agony-sparing hint sheets.

Unnkulia One-Half is free -- don't pay us for it!

Unnkulia Zero is US$25 and is available via mail order from ADVENTIONS or via phone (credit card order) through High Energy Software. Unnkulia One-Half comes with a playable demo of Unnkulia Zero, which includes information on how to order the complete version.

Happy adventioning!

Dave Baggett
ADVENTIONS

Internet: dmb@ai.mit.edu
Compuserve: 76440,2671
GEnie: ADVENTIONS

A Word About TADS

We at ADVENTIONS use a programming language called TADS to write our games. TADS is a product of High Energy Software, and you can get it via FTP.

TADS (and TADS goodies) are available for many systems from ftp.gmd.de. Look in the if-archive/programming/tads directory.

TADS is also shareware, and we strongly encourage you to register it if you use it, since we feel it is a powerful, innovative, and very inexpensive development system that deserves to be paid for.

: > most of the CNF statements, and now, MiNT just pukes, and exits
: > with an error code of 65502???

: That's the same problem I've had; even after taking out -DMULTITOS, I
: still haven't been able to build a kernel that will let me get to the
: GEM desktop. It loads tcsh finely as a shell, but dies if I try to go
: to GEM.
[...] deleted some adress-stuff

There is still some trouble with MiNT, as I dig out here. I use MiNT1.04
after compiling it with gcc2.3.x. When I leave out the INIT=c:\somewhere\my\
favorite\shell.ttp MiNT comes up directly with the GEM-Desktop. Nevertheless
(*dunno if its the right word*) it boots fine with a preleminary release of
bootgem (after setting INIT= to the apropriate shell). ''My '' Version exits
with an exit-state of 65xxx when I try 'kill -9 xxx', the program wich came
with former MiNT-Releases. (btw: I used the whole stuff on a 1040STFM with
TOS1.04)
Finally a question: Is there a sollution for the ''bombing'' after pressing
[ESC] when a Window of drive a: ist active? Almost everything works fine when
I use a window created by ''clicking'' on u:/dev/a/ but it bombs/crashes when
I ``click'' on the icon of drive a: and then press [ESC].

Thanx in advance,
yours,
Jam

|> >>track, how outdated can you be?

The same reason you waste .5k per file, you have to store the directory
information someplace. Granted the Amiga method is more efficient for floppies
with few files on it, but it is not interchangable with other micro processors
platforms.

|> >
|> >
|> >NOTE: Atari uses the Standard IBM Format, far better than any thing that Amiga
|> >has PLUS CRC data checking...beat that ..
|> >
|> >Plus we can Format 10/11 sector disk with external programs..
|> >
|> >Facts man just facts..
|> >
|> >
|> How can a system that only handles one disk-format (IBM) be superior to a
|> system that handles numerous (including IBM) ?

Please define numerous. Are you referring to MFM and GCR, which is two
physical formats. Are you referring to the ability to handle more than
IBM 360k, 720k and 1.44meg formats, which is also more than 1 format.

How about the following:
Capacity Sides Tracks Sectors
360k 2 40 9
364k 1 81 9
368k 1 82 9
360k 1 80 9
400k 1 80 10
404k 1 81 10
409k 1 82 10
440k 1 80 11
444k 1 81 11
449k 1 82 11
720k 2 80 9
728k 2 81 9
736k 2 82 9
800k 2 80 10

808k 2 81 10
816k 2 82 10
880k 2 80 11
888k 2 81 11
896k 2 82 11
1440k 2 80 18
1449k 2 81 18
1458k 2 82 18
1520k 2 80 19
1529k 2 81 19
1538k 2 82 19
1600k 2 80 20
1609k 2 81 20
1618k 2 82 20

Now if you consider all these as formats, then Atari's support a lot more than 1 disk format under TOS-2.06. TOS 1.xx does not support the HD drives without add-on software. If you do not consider all these as formats that is your perogative, but please be a little more specific in the future.

With the add-on hardware of Spectre GCR all GCR coded disks are available, though no one has bothered to write a driver to decode Amiga disks. (The corallary to the old law of supply and demand: if there is no demand why bother to supply)

|>
|> What so great about CRC when it doesn't prevent write-errors?
|> Just wondering.
|>
|> NjE
|>

It will let you know that when you wrote to the disk that there was a media error and you can change disks and rewrite your file, so you do not have bad backups. It will also let you know if your disk has been corrupted since you wrote it. Typically I believe it is good to know that you have a problem with your media. Though you can disable write verify on your floppies I do not recommend it.

6618. SpeedoGDOS & NVDI problem

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 16:15:41 UTC
From: castermn@nlsce1.seri.philips.nl
Message-ID: <1993May6.161541.2918@seri.philips.nl>
Source record: 206347

Help, I have SpeedoGDOS 1.0 and NVDI 2.11.
I would like to combine the speed of NVDI and the GDOS
part of SpeedoGDOS. However I cannot run them together.
After switching off the NVDI GDOS via the CPX also
SpeedoGdos seems to be switched off. If I reverse
the order in the AUTO-folder the machine hangs.

Under MultiTos/SpeedoGDOS I can see window redrawing again.
Aggghh. Could somebody help ...

oooooo...I'm so impressed. Eleven character filenames, ooooooo! :-)
Standard IBM format is NOT better than anything the Amiga has... time to
use your Comp. Eng. knowledge to find out about it. OFS, FFS, DCFS...
any meaning to you?

>Plus we can Format 10/11 sector disk with external programs..

Yuk,yuk,yuk snort! :-)

There is a port of SOX for the ST -- I pulled it off atari.archive a few months ago, but haven't had much chance to play with it.

Play20 is a damn fine sample player -- Dave Bagget has done the ST mob proud again.

Whoever wrote this is an idiot, at least completely ignorant of the
production problems Atari is (was?) having. Do you think they have been
turning out 50,000 units a month for 5 MONTHS?!?! Do you ever follow
Atari news? According to reports they've been making them in the range
of hundreds or a couple thousand a month for most of 1993 so far. Only
in the last month or so have they been ramping up apparently.

MiNT pre-0.99 won't work on Falcon because of Falcon's Srealloc() call. You
need to grab the latest sources and compile 'em.

He's referring to the ability of reading PC, ST and native Amiga disks (DD and
HD). Plus of programming your own sectors/track, tracks/disk *yawn*

[...]

> Now if you consider all these as formats, then Atari's support a lot more
> than 1 disk format under TOS-2.06. TOS 1.xx does not support the HD drives
> without add-on software. If you do not consider all these as formats that
> is your perogative, but please be a little more specific in the future.

Sure, but the Amiga can be programmed to read more/fewer tracks/sectors as
necessary, simply by adding a new device handler. I'd assume it can read all the
formats you mention (since they don't rely on variable-speed drives, and are all
MFM-encoded). Plus, of course GCR blah blah blah.

> With the add-on hardware of Spectre GCR all GCR coded disks are
> available, though no one has bothered to write a driver to decode Amiga
> disks. (The corallary to the old law of supply and demand: if there is no
> demand why bother to supply)

Amiga disks are MFM coded. And, of course, since the Amiga reads and writes ST disks very simply, why would you want to have some complex hack to allow the ST to read/write Amiga disks?

> |> What so great about CRC when it doesn't prevent write-errors?
> |> Just wondering.

> It will let you know that when you wrote to the disk that there was a

shrug again, I've never had a problem with lost files; I did have a screwed-up disk once (no-name cheep one... Never bought those again :), and the OS returned a "Disk screwed. Waste it" message. So what's the big deal?

6626. Spectrum elulator - loading code.

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 19:16:48 UTC
From: csylab@scs.leeds.ac.uk
Message-ID: <1993May6.191648.13559@gps.leeds.ac.uk>
Source record: 206248

HELP!!!!

I remeber someone posted a machine language version of a program
to load spectrum games through the printer port of an ST. Then
someone complained they could not compile it so asked him to post
the actual executable.

Could the person concerned (sorry for the formality here) please
either post (or repost if I missed it) the executable?

Or perhaps upload it to atari.archive ?

Baal.

6627. NEW SOFTWARE NOT WORKING! HELP!

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 19:18:02 UTC
From: seacat@carson.u.washington.edu
Message-ID: <1sbo9aINN29m@news.u.washington.edu>
Source record: 206206

Ijust got my hands on STOS, and was all excited to try it out, and when I
tried to load any files into, it didnt work. The mouse pointer doesnt move
and seems useless. And everytime I try any of the examples in the manual
just to get a look at it, it comes back with "BAD FILE FORMAT".
If I try to load a sprite file, or backround, or anything, even accesories
I get the same message.

Antic seems to have vanished.
Mandarin Software doesnt exist
And Terrific Software has a phone line thats been disconected.

What do I do?
HELP!

Did I buy a worthless piece of software?
Am I stuck with it?
Even the store I bought it from went out of business just a few weeks ago.

Thank you...

On a related note, does anyone have the problem of MonSTEr crashing on them if you move the mouse all the way to the bottom right corner in the low rez (320x200 -> 640x400) mode??
It's a bit irritating, as I always have to be careful not to move the mouse too much (I also have Maccel3 going, so it's realoly easy to hit that particular spot..)
Other than, that it's great! Only whine....Wonderland won't use the entire screen...!! :(

|>

It isn't that important if a product is good or not??? Well, if I pay my hard-earned money for something, it better be good... regardless of how good the salesperson says it is. That is why I bought an ST instead of a PC. I write Windows code at work, and I knew that I didn't want to be saddled with having to use Windows at home also!

Unfortunately, companies had a mob mentality a few years ago, and as a consequence, they bought IBM PC's for their office because (1) IBM said they were good and (2) the other company (the competition) is using them.

Just because many companies bought into the `Windows rules' idea doesn't mean that individuals getting a computer for home use need to be brainwashed into making the same decision.

There is definitely a version that works with regular STs. I am not sure if
it is the exact same binary, or if there are different ones.

> What kinds of things does it work with? Things like Uniterm only, or tings
> like ConNect only, or graphics applications only, or what?

Just about anything that is GEM complient (and asks for a screen size). I
have no idea what it would do with a character based (TOS or TTP) application.

> What is MonSTEr _intended_ to do, or to work with?

The monitor acts as a "peephole" to a much larger virtual desktop. The
peephole moves when the mouse hits the screen boarder. Thus, you can easily
have GEM windows bigger than the physical screen, or have lots and lots of
smaller windows.

To my understanding, it was originally intended to allow programmers to check
if their work is compatible with very large screen monitors (like the Viking),
without having to buy one. The huge virtual screen is extremely cool whether
you program or not, though.

You may be interested to know that there is at least one screen dumping
program out there that will dump the entire virtual screen (not just the
physical screen) when using Monster. There was a blurb about it in a recent
Current Notes.

6632. SW for Appletalk

Newsgroup: comp.sys.atari.st
Date: 1993-05-06 20:52:19 UTC
From: lusiani@dxcern.cern.ch
Message-ID: <1993May6.205219.23544@dxcern.cern.ch>
Source record: 206212

I'm new here and I'm posting this for a friend.
Does any software exist for accessing Appletalk with the Atari ST?
My friend claims he has the interface but not the software.

Please answer me by e-mail (lusiani@dxcern.cern.ch)

Best greetings,
Alberto

> desk accesories run while they are closed? The OS provides for this
> or just specific desk accesories do it?

The AES in TOS had a limited multitasking kernal which allows one
application and up to 6 desk accessories running at the same time.
And yes, those desk accessories could do things while they were closed.
Alot of desk accessories do.

Another point... With MultiTOS, you can run multiple applications and as
many desk accessories as your memory will hold at one time. In addition
to that, Atari supports _hardware_ memory protection for the TT and the
new Falcon030 machines. Does the Amiga have pre-emptive multitasking
with hardware memory protection?

I am not sure what the point of your posts is here, but you are wasting
our time if you are here just to start fights or to start the childish
my machine is better than your machine wars that went out of style in
1984 or so.

So, do us a favor.. if you are truly interested in finding out about
Atari machines, then ask questions. if you are here to cause trouble,
then please direct all of your future posts to /dev/null and stop
bothering us!

Thank you!

John Townsend

PS. BTW.. I would have posted this in Email, but since you don't have
the facilities to get Email, I can't do this.. please accept my
apologies fellow netters.

Not only in this mode but in hi-res too. Though I only get crashes in some
programs, not on the desktop for instance.

>Other than, that it's great! Only whine....Wonderland won't use the entire

Neither will any of the Magnetic Scrolls compilation adventures :-(
Does anyone know if they will work on the TT/Falcon modes such as 640x480
x16 ? It would be really nice to have colour graphics and still have readable
text...

AP>
AP> i was just going to have a 6ms step rate. i can't visualise exactly what you
AP>are saying: Some kind of delay before you switch step rates i gather ?

No. The FDC's step timing is derived from the 8MHz clock, so when you
supply a 16MHz clock, you get half the step pulse width. That's why you
have to switch to 6ms with simple HD circuits to get effective 3ms. Now,
if you switch the clock to 8MHz for just a bit less tham 3ms after the
STEP pulse (even if there is a HD disk in the drive, that's the trick),
then the timing is just right to get about 3ms steps without any software
needed - and that's where the MMV is used. The time during which the clock
is switched down to 8MHz has to be less than 3ms because otherwise the FDC
would, after the STEP pulse, try to read / write the first portion of
the track with 8MHz clock, which will not work on HD disks.

The best method is to make the MMV adjustable, and adjust it so that the
stepping noise in HD mode is a bit higher than in DD mode (when stepping
from Track 0->79->0->79 ...).

>true...

It probably is true - but meaningless, since it includes the proviso
"[at] the current production rate". If the Falcon is a commercial
success, you can expect the production rate to increase. If no-one
buys Atari hardware, it will not be a success, and you'll never see
a two-piece model.

I've bought my new Atari hardware.

NVDI should load BEFORE Speedo in the auto folder. The GDOS setting of
NVDI is then automatic, you don't have to worry about it.
Next, your NVDI drivers should go in the same folder with the Speedo
fonts and printer drivers. The Assign.Sys file should point to that
directory.

Have you tried Austech in Blackburn? I'm not particularly fond of them
but they may have what you need. Also, Megatron in Ringwood are the
authorised Atari service centre and may possibly have the ROMs. One other
place to try is Mega Computers in Tecoma.

>color mode makes the thing even faster at scrolling and formatting
>text. Who need 256 colors anyway while doing wordprocessing.

Precisely. That's why all those resolutions are available: so you can
tune the performance of the machine to your requirements. If you're
looking at a JPEG image, you'll want the beautiful 65536 colour mode.
If you're word processing, a 4-colour, 2-colour, or 16-colour at the
most will be your choice. Remember the choices on the old 8-bit? You
could go from Graphics 3 (40x24 pixels in 4 colours!!!) to Graphics 8
(320x192 pixels in 2 colours!!!). My LightCycles clones was in
Graphics 3, and SpaceBattle was in Grpahics 8. Everything has a use.

Ask any 386/33 Windoze user - more than 16-colour desktops is treacle!

COmp.sys.atari.advocacy?

hmmm

also, re 100 sprites on 7800..

wellllllllllll :) Ever see the ou5soft demo?

counting up colored sprites, there are only 10, but counting TRUE
"sprites", there are 29 .. at least! :)

that aint too bad for a computer that actually only has >5!<

and NO, they arent all seperated vertically on the screen! 8 of them!
(the 8 3-colored ones = 24 true plaer/missles!) are all bouncing around
in the same location on the screen!

RIGHT SMACK DAB IN THE MIDDLE of >3< graphics modes per scanline!

wowowowoowoww1!!!!!! id like to see some of those games developed by
our5oft..

that reminds me, i still need to write them! :)

Depends on where you are I guess. :) Throughbred Music in Sarasota,
Fl, got some in about a week or so ago. I drove down
with my friend last Friday (31st I think) and he bought one.
They had at least one left, on hold for another customer. :)

While we were there, some people called to see if they ha dany... Looked
like it was a pretty popular item down there. :)

ANyways, it's a cool machine. I'd get one if I had the cash.
Although I might spring for a TT first, since they have more nbumber
crunching power... Then again, who knows...

Good luck finding yours. They'll probably be easy to
order soon.

] >On a related note, Why do ST's waste 160K per DD disk? I mean, 9 sectors
] >per track, how outdated can you be?

PC's use 9-sectors, they are hardly outdated!

I can quite happily format 1 to 11 sectors per track (inclusive)
1 to 82 tracks per disk (inclusive)
1 or 2 sides per disk!

So, I can easilly format my disks to over 900K!

] No, but the Amiga can format, read and write MS-DOS (and, of course, ST)

Not without additional software though!

Impossible to find a TT? How many dealers did you call? Which ones?

If I wanted to buy another one tomorrow, I'd be surprised if my local dealer
didn't have any. If he indeed didn't, I'd be even more surprised if I
couldn't find one on my second or third call. They can't be that hard to
find. Sheldon Winick in NC is still selling them and MegaSTEs.

>
>No, but the Amiga can format, read and write MS-DOS (and, of course, ST) disks.
>

Next time you log on, please remember to plug your brain in. You (and other Amigoids) seem to make a whole point about how you have an OS that does it all for you ... well, I'll tell you what : It stinks !!
You can read ST/DOS disks ? well so can *ANY* computer that can read a floppy. Just because those who wrote the OS thought of a specific way of representign the data, does not mean the entire computer must work with that. If I knew what the disk format was on the Amiga, I could write the driver myself. Sure, it'll be slower because I won't be using specific hardware, but it'll work just the same.
The fact that the OS does everything goes to show how incompetent you guys are in writing software. If commodore didn't put it in, then no one will !
What a strange way of thinking ...
And disk formats isn't the only thing like that. Just take the 4096 colors you guys always brag about. Well, if on my ST (Which allows only 16 colors out of 512) I can display 512 colors anyways, why don't you try having those 4000 colors without using what's provided to you. go into the lower modes, and try to write something that will allow you to have more colors and/or lines. Could YOU write an overscan for the amiga, or is setting your video controler to that pre-chewed mode the only thing you can do ?

So please, if your computer does more, it's not because it's better. It's just because others have thought it out so your poor mushy brain won't have to. Hardly anything to be proud about.

>Sure, but the Amiga can be programmed to read more/fewer tracks/sectors as
>necessary, simply by adding a new device handler. I'd assume it can read all the
>formats you mention (since they don't rely on variable-speed drives, and are all
>MFM-encoded). Plus, of course GCR blah blah blah.

wow ! what an achievement ! getting a controlleer that can access X sectors to read less than that ! Gee, you sound like a genius ! Care to tell us how to obtain such greatness ?

>Amiga disks are MFM coded. And, of course, since the Amiga reads and writes ST
>disks very simply, why would you want to have some complex hack to allow the ST
>to read/write Amiga disks?

Again, why do you think it can read them ? because the "complex hack" has
been dne by people who knew you'd be incapable of doing it yourself.

>*shrug* again, I've never had a problem with lost files; I did have a screwed-up
>disk once (no-name cheep one... Never bought those again :), and the OS returned
>a "Disk screwed. Waste it" message. So what's the big deal?
>

Never did I. But maybe if you had the check, then you could have known
before the entire disk was good for the trash bin, and saved everything
except the last one written (The one that screwed things up).

Patrick.

Oh great, now we have some one flaming the Amiga because, get this, it does TOO much for the end user!

Having the OS be able to read several disk formats by itself is definitely a plus... Actually it isn't just the OS. My PC can't read Macintosh GCR disks (400k/800k) without special hardware; I don't think the ST can either.

[point moot now, HD is taking off on the Mac.. and were all using MFM now]

Why flame useful features?

(and get this out of comp.sys.atari.8bit!)

If you have it connected to a VGA monitor your always in 60 Hz, so the
demo won't run. You MUST connect a PAL RGB TV for that program.

First, I think this topic has gone too far. I personally feel that
it does not belong here. Please take it to the .advocacy group.

Secondly, I personally do own an Commodore A4000/040 as well and I
find your generalization of "Amigoids" as people who takes prides
in havind "OS that does it all for you ..." as being rude. Maybe another
Commodore user had started the whole argument, but who knows by now.

As I said before, I think this topic should move on to
the .advocacy group COMPLETELY now.

> One last thing about this game, I wonder if it is not easier to win on ST
> than on PC. After several easy victories, I never met a civilisation that
> was really developped (even on king level). Does anyone have the same
> sensation ?

I've never tried it on a PC, but it does seem quite easy so far. I've had
5 games so far:
1) Easiest level, getting to grips with it, was most powerful civilisation
at end
2) 2nd level, won by building spaceship
3) 3rd level, was far behind Chinese in tech, and feeling very opressed, until
I took their capital, causing a civil war and putting myself in a good
position - too late to win before time was up though.
4) 3rd level, earth, wiped everyone else out by 1980ish
5) 3rd level, random, wiped everyone out, again earlyish

I'm busy at the moment, but when I get the chance I'll try it on the 4th level.
It does seem a bit easy so far.

Great someone who also likes the M/Scrolls adventures. Could yougive me
a hint (or someone else, why post?) how to get the parrot out of the
cage in FISH! ? The few hints the handbook gives are not enough for me
(shame shame shame)...

Erlend.
P.S. I don't think they will work, although the program works in both
medium and high res.

6659. Uudecode - HELP!

Newsgroup: comp.sys.atari.st
Date: 1993-05-07 09:54:45 UTC
From: rgibson@cs.strath.ac.uk
Message-ID: <1sdbl5$1c7@simpson-04.cs.strath.ac.uk>
Source record: 206242

I am needing some help on how to get all the files I`ve ftp`d uudecoded.

I tried using uudecode on one of my files and it came up with:

No begin line

I am bringing the files in on the SUN Sparcs at Uni, then ftping them
to an old PC (still in Uni) then putting them onto disk from there.

I still haven't managed to dearchive any of the files at home - I presume
this is because they aren`t `uudecoded`.

Any help with how to use Uudecode would be appreciated - I`ve asked around
here but no one seems to have a clue.

Ronnie.

STOS is really funny about what machine you have as I remember, but the newer versions can handle STE's ok which was the major complaint.

I guess your not trying to run it on a Falcon or TT?

Not much help I suppose, but like I say, its possible it does not like your machine if it was not written for it. Alternatively, get Heat N Serve C or Lattice C (if you can afford it) and learn a decent language! - IMHO.

Have you been TOLD about the advocacy group ?? I was just wondering because
every time I read one of your comments, it always contains two out of:
Atari, Amiga, Mac (and variants thereof).

I REALISE YOU HATE ATARI'S (even though such feelings towards an inanimate
object, or the corporation/people it represents COULD be defined as an illness)

IN FACT, I'M SURE EVERYBODY REALISES YOU HATE ATARI'S

My point is, this type of comment NO LONGER BELONGS HERE.

I apologise to every (reasonable) reader of comp.sys.atari.st, but I felt
someone should respond to these noises.

ANY RESPONSES PLEASE POST TO c.s.a.advocacy .... THAT's WHAT ITS THERE
FOR !!

Dave.

> Starglider?

Yeah come on, surely any computer (even my trusty old BBC model B)
can play a sample and do nothing else at the same time (Starglider attract
sequence).

For good ST music outside of demos, I'd go for the Turrican stuff by
Jochen Hippel (hope I got his name right). That had 'standard' sound
chip stuff with little digi-drums, very clever.

Neil Pearce. (Remember Neil of Cor Blimey? - No you probably don't)

: chip stuff with little digi-drums, very clever.

Yup, you got the name right. But he's more know as Mad Max of TEX. Yes, a demo-guy! The digi-drum stuff was "invented" by democoders to get good music and at the same time lots of free processor-time. Jochen has created the songs to dozens of commercial games. He's about as famous as Rob Hubbard once was on the C64... :-)

I may not be right on this one (so no flames please), but i belive that Mac disk drives spin at different speeds depending on where the disk head is (ala CD-ROM).

If it was MFM or GCR the Amiga would be able to read it.

If Atari is not making that many, the company is in trouble.
They have no new products widely available.

WE are actually in worse shape than we were back in 1986 when most
ST computers were shipped to Europe. At least then, the company met
at least half demand.

Well, I think I should apologize for my previous post. I was not quite
aware of the kind of people I was refering to.
After many hours of wondering why they even bother posting here, I decided
to make a little trip down to their place : comp.sys.amiga.advocacy.
It was, how should I say ? weird. Yes, just plain weird. There were a number
of threads (Not too many). The main one was debating between the Amiga and
PC's, almost along the same lines as here. Another was criticizing the QUERTY
keyboard, and others were comparing "old technology" with the new one
(Like the PET and C64 !!). Others were wondering who in their midst will be
the last one to post on their group. One even posted an article (Subject :
Amiga is #1) and says quite frankly that he posted it so it'll start a new
flame thread, and behold ! It's working !!
But one thing that *really* shocked me, was to see that there was no thread
on the ST! Sure, it may be that during a Amiga-PC debate, one would go "Oh,
and the ST sucks by the way" out of nothingness, but there were no major
attacks. So, we just happen to have amongst us those frustrated ones who
feels they cannot let a platform untouched by them.

I'm sure not all Amiga owners are like that. I know some who are very aware
of what the different systems can and cannot do, including their own. I
think we're just unlucky. I mean, here they are, posting in our group about
how their new A1200 (Which came out when ? less than a year ago ?) with
our 520ST (First released back in '85, so the design is even older).
They might as well be comparing the ZX81 with the latest from SUN. Has
anyone noticed that they *never* flame about the TT, just because they know
it's more powerful than the ST, and thus they can't say much bad about it?

And I will reiterate my previous post saying that the power of a computer
is not the same as that of the OS it has. I totally agree the ST's desktop
sucks real bad, but there are alternatives. If your Amiga OS allows you to
read all disk formats, then good. Ours doesn't simply because we never needed
it, and so no one ever wrote anything to do so. Generally speaking, the
ST does not have as much as the Amiga when you buy it, but it doesn't
mean you *can't* have it, just that you're not forced to pay for something
if you're never going to use it. How many Amiga users run their WP in full
4096 color mode ? OK, maybe they will use it for games, but that's about it.
And if you don't want to play games, you bought an expensive piece of
hardware for no reason whatsoever.
Sure, you'll say "But if we want to use something, we don't have to go
anywhere, because it's already in there". I agree. But on the ST, if you
wanted it from the start, you would have bought the required hardware
along with the machine. And what you don't need, you don't pay for.

I've had my ST for 6 years now, and I still like it a lot. It seems, however, that most Amiga owners feel they have to buy the newest release everytime. Many of you say you've had (And probably still have) the 500, 3000 and now the 1200, plus all the others whose number I don't remember (Why can't Amiga get those number to grow, and not jump up and down randomly).
If the computer had indeed been well made, you wouldn't have to change it every year. No one with an ST (At least no one with a sane mind) would have sold it to get the STe. Not enough difference. Buying a TT or Falcon is another matter. They're way more powerful than the STfm, and thus are good reasons for changing.

Anyways, I'm sick of those wars. They're stupid, pointless, and make it look like all Amiga owners are nerds, when that really isn't the case. Just a couple of them (There are Atari nerds I'm sure, but they keep silent)

Patrick.

Congratulations. This post has got to be THE most incredibly brain-dead drivel I have EVER read. I just hope to God Dr. Kevorkian drops by your wing of the asylum.

> So please, if your computer does more, it's not because it's better. It's
> just because others have thought it out so your poor mushy brain won't
> have to. Hardly anything to be proud about.

I think this sums you up fairly well. What are you doing with an ST? I mean, it has BUILT-IN routines, right? I mean, you wouldn't be caught DEAD calling an AES routine, now would you? No, I guess you'd rather program the 68000 in microcode, using a 5v power supply and pencil and paper (wel HELL what do you want memory chips for?)

> Again, why do you think it can read them ? because the "complex hack" has
> been dne by people who knew you'd be incapable of doing it yourself.

I assume, of course, that when your ST boots up, it uses your own disk loading routine, hand-fed in at boot time by you setting individual bits of memory.

> >*shrug* again, I've never had a problem with lost files; I did have a screwed-up

Has anyone tried any of those "50/60hz" software programs on the Falcon?
Would this have the same effect as it has on a regular ST on a U.S.
monitor? (could've sworn I've used one on my Multisync to do 50hz)
Or am I missing something?

Yes, you'll likely to need STOS 2.5 (or 2.6 I think) for an STE with TOS
1.4/1.6/1.62.
Upgardes are available in the public domain including the compiler upgrade.

>
> I guess your not trying to run it on a Falcon or TT?

It may be ok on Megas/TTs except the mouse/joystick ports may screw up.
As already stated, why not write in C ?, but thats another debate.

A guy in our user group has a Falcon and this demo seems to run fine on it when connected to a SC1224. It might have been set to 50Hz or something by one of those 50/60Hz programs, but it _was_ working great on the normal ST color monitor, which I don't believe is PAL... :)

Just a thought, perhaps it needed interlace mode to run, some Falcon demos seem to have this property. Anyhow, since the SC1224 does interlace this might be the explanation for it.

6680. Conneticut Atari Fest 1993

Newsgroup: comp.sys.atari.st
Date: 1993-05-07 17:03:32 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1993May7.130332.14974@umiami.ir.miami.edu>
Source record: 206263

FOR IMMEDIATE RELEASE

CONNECTICUT SHOW TO FEATURE ATARI'S LATEST ENTRY

HARTFORD, Conn. (April 12) -- More than 1,000 Atari computer enthusiasts are expected to converge here June 12 and 13 at Connecticut AtariFest '93, and are certain to debate whether the star of the show -- the long-awaited Falcon030 computer -- lives up to its advance billing.

The Falcon030 is a perfect low cost tool for the professional artist, with 8 track, 16 bit musical capabilities, true color graphics and a 32 bit DSP chip. The Falcon will be bundled with several music programs, including a 4 track 'Direct to Disk' editing and recording program, a sound sampler and an all purpose productivity package called AtariWorks.

The Hartford show will likely be one of the first encounters the general public has with the new machine and software leading designers have produced for it. Atari was performing quality control tests on the latest production models shipped to the Sunnyvale headquarters in mid-April.

The two-day event will feature more than 40 exhibitors, including several of the top names in music software development and MIDI equipment. Tentative music exhibitors include Barefoot Software (formerly Hybrid Arts), Digital F/X, Steinberg/Jones, Pro Musica, Compo Software and others. The show, sponsored by ACT Atari Group, will be held at the Windsor Court Hotel, just off Interstate 91 at exit 42.

Connecticut AtariFest '93 promises to showcase the work of several musicians and will include some live music sessions.

Other vendors will demonstrate new equipment and software that will be of interest to musicians whether they're on or off the job. Among them, organizers have received tentative nods from A&D Software, ABC Solutions, Baggetaware, Barefoot Software, Compo Software, Computer Studio, Derric Electronics, East Hartford Computer Repair, Gribnif Software, ICD Inc., MegaType Software, Soft-Logik Publishing, Toad Computers, Wizztronics. Last year 14 user groups participated, and that number is expected to grow by June.

A Home Business and Entertainment Expo that will focus on high-tech gadgetry designed for home use is also planned. Central activities will include a New England Lynx Tournament for the gamester in the family, a Portfolio corner for the on-the-go palmtop computer user, and other

technology such as VCRs, lap/palmtops, voice messaging systems, satellite receivers, CD-ROM, fax-modems, large screen TV, printers, audio-video components, cellular phones, office supplies, video games or add-on units and accessories.

For further information, contact organizers Brian Gockley at (203) 332-1721 or Doug Finch at 203-637-1034. Subscribers to GEnie and Compuserve on-line services can send E-mail to them, respectively, at B.GOCKLEY or D.FINCH7 on GEnie and 75300,2514 or 76337,1067 on CIS.

>>
>Next time you log on, please remember to plug your brain in. You (and other
>Amigoids) seem to make a whole point about how you have an OS that does it
>all for you ... well, I'll tell you what : It stinks !!

No it doesn't, its professional, supported software. Something you're
not used to on the Atari? :-) :-) :-)

>You can read ST/DOS disks ? well so can *ANY* computer that can read a
>floppy. Just because those who wrote the OS thought of a specific way of
>representign the data, does not mean the entire computer must work with
>that. If I knew what the disk format was on the Amiga, I could write the
>driver myself. Sure, it'll be slower because I won't be using specific
>hardware, but it'll work just the same.

No it won't.. does TOS have replaceable disk drivers? Probably not.
I seriously can't believe that ANY Atari user thinks like you do,
who WOULDN'T want the OS to automatically support these features?

>The fact that the OS does everything goes to show how incompetent you guys
>are in writing software. If commodore didn't put it in, then no one will !
>What a strange way of thinking ...

Actually, it shows how ignorant you are. Like MultiDOS for the
falcon, many of the OS enhancements though the years have been sparked
by third party products. Arexx, CrossDOS, arp.library, etc, etc...

>And disk formats isn't the only thing like that. Just take the 4096 colors
>you guys always brag about. Well, if on my ST (Which allows only 16 colors
>out of 512) I can display 512 colors anyways, why don't you try having
>those 4000 colors without using what's provided to you. go into the
>lower modes, and try to write something that will allow you to have more
>colors and/or lines. Could YOU write an overscan for the amiga, or is
>setting your video controler to that pre-chewed mode the only thing you
>can do ?

You REALLY need an education. Dynamic hires, SHAM, PCHG, and assorted other display tricks. GO back to your 512 color atari and enjoy your ignorance. If you really think doing everything yourself is such an advantage, why dont you throw out your 1040 or whatever and get an atari 2600... you dont need a keyboard of course, just use the joystick buttons... only incompetent people need a keyboard. duh.

>So please, if your computer does more, it's not because it's better. It's
>just because others have thought it out so your poor mushy brain won't
>have to. Hardly anything to be proud about.

Whatever dude.

>wow ! what an achievement ! getting a controlleer that can access X sectors
>to read less than that ! Gee, you sound like a genius ! Care to tell us
>how to obtain such greatness ?

Easy, GET A CLUE. Do you know anything about the Amiga's floppy disk system? With all your bragging, I bet you couldn't even write an Amiga MFM disk loader.

>Again, why do you think it can read them ? because the "complex hack" has
>been dne by people who knew you'd be incapable of doing it yourself.

This incompentent tint again. Why do you use TOS? Why not write your own OS, since otherwise you'd be "incompetent".

I'm searching for a software running on ATARI ST which gives me the possibility to draw chemical structure formulars.

It should be able to read the output - files in order to link them with text.

Is there anybody out there who can help me?

Mail to: buchberg@winx06.informatik.uni-wuerzburg.de

Thanks.

PC's are outdated since their introduction. If you want to defend an ST by pointing out its similarities to a PC you're a long way from home.

6686. Take Control Music DTP - Is it good?

Newsgroup: comp.sys.atari.st
Date: 1993-05-07 19:20:43 UTC
From: fnsbo@nsd.uib.no
Message-ID: <fnsbo.94.736802443@nsd.uib.no>
Source record: 206269

A friend of mine just paid appr. 350 UK pounds for a Music DTP program called TAKE CONTROL. The documentation is scarce and things doesn't seem to work like one should expect from a program at such a price. The program is produced by 'Research and Development Institute' in Birmingham.

The first diskette he received was corrupt. The second seems to work, but my friend especially complains about the quantization. The program changes quantization on midi-files imported from e.g. Cubase. So far he has not been able to produce input from a keyboard (synth) in a proper way.

Have someone out there experience with this program? Is it worth the price? Or have you heard of this R&D institute in Birmingham?

Thanks for any information!

>

NVDI is a replacement for the VDI and GDOS. It is similar to Warp9 but
better because it is compatible with all programs I have tried. It works
in all screen modes on all ST/TT/Falcons. It's GDOS can be switched on
and off at any time form a CPX. It is a little faster than Warp 9.
NVDI is almost a standard in Germany and becoming one in the UK.

Ofir ogal@cix.compulink.co.uk

Experience is something you don't get until just after you need it.

No I don't hate Atari's. I have owned there products in the past..I am just
fed up with the slow development of the platform and being taken as a sucker by
Atari's management.. Yes the Falcon is decent, but it should have been out
along time ago with more model variations...The Falcons will sell to the
converted, but thats it, so the installed base will not grow....

^^^^^^^^^^^^^^^

None, HAM is for graphics work, and it's very good at it. (Now does 262144 colours.)

|> And if you don't want to play games, you bought an expensive piece of
|> hardware for no reason whatsoever.

I use mine for wordprocessing, programming, graphics and just because I enjoy using it. I very rarely play games. I don't consider this to be no reason whatsoever.

|> Sure, you'll say "But if we want to use something, we don't have to go
|> anywhere, because it's already in there". I agree. But on the ST, if you

|> every year. No one with an ST (At least no one with a sane mind) would have
|> sold it to get the STe. Not enough difference. Buying a TT or Falcon is

And there was not enough difference between the 500 and 600, or the 500 and 2000, or the 1200 and 4000 to upgrage. Of course, going from an A500 to an A1200 is another matter. They're way more powerful than the A500 :-)

|> another matter. They're way more powerful than the STfm, and thus are good

Well,there is no way... A midi file contains ONLY sequence info.
It had no sounds. To play it,you need a MIDI expander or synth.

The "playable" files are .MOD,but this is another story!!!

See ya

Ok, whatever.. but your previous post was full of drivel about Amiga
programmers or whatever being inferior because they can't write MFM
disk loaders. What kind of nonsense is that?

>I've had my ST for 6 years now, and I still like it a lot. It seems, however,

Exactly why people upgraded from the 500->3000->(4000/1200). I'm sure
there are many atari users who went from 520ST->TT->Falcon, or will go
that route.. no difference.

Two of my favorites are Dungeon Master and Armour-Geddon. Even though,
I have yet to finish either.

Has anyone ever won at Armour-Geddon?

Looks useful. I'll be trying that soon.

I just got a note in the mail today from MicroProse saying "Thanks for your letter. Please send your original disks in, and we'll send you updated copies."

Don't know if that's a great idea, but it's probably worth a try.

Well a chap here in NZ. is claiming 13 megs on a ST..
beet that...

I did read it some were the mods for this memory, but I think only
the CPU has access to it. like the TT and Amiga set ups...

There will be no problem exchanging the MFM-Drive, i guess. But it's
a hard thing to add a second drive to your Megafile.

Your main Problem will be getting an used MFM-Drive, you will
find no new Drive, because they are no longer produced. And years
ago, when the PC-People used MFM-Drives, they didn't have the
big capacity they have now. Be careful *not* to buy a RLL2.7 Drive!

Getting a new SCSI-Drive is a faster, better and less complicated
way: You don't have to care about bad blocks, you get a better
access-time (It *is* a difference between 15 ms and 28 ms, believe me)
and you get a better transfer rate, up to 1 MB/s.

Over here, they charge about 400 DM for a 105 MB (Quantum) Drive.
Some people like the LINK-Cable, it seems to be plug and play, but
i'm not sure.
You may even get an used ICD-Adaptor (mine?) for less then 100 DM.

That makes 500 DM abt. 350 C$, i guess.

I hope that helps

Axel

>as a seperate, new computer. Not helped by identical casing perhaps? Mind you,
>virtually all old ST MIDI software is compatible anyway.

This is the conclusion I've come to, after playing with our store demo
unit for 2 weeks now... This is not a flame, frankly the ST has needed
a "souped up" version for several years. The proof is in the pudding,
so to speak. What will sell the Falcon is new, Falcon-only software.
(We have the egg, now we need a chicken....) The only thing I've seen
come down the pike is MusiCom, and a VERY SLOW TRICKLING of p.d/shareware
stuff.

It's not easy handling all those color at once. The trick, or so I've
come to believe, is to find the lowest number of colors you care to have
in a program. If you're looking at GIF pics, use 256. If you're running
Flash, use 2...

>You can actually see this when using the Falcon. Under MultiTOS, the
>drop-down menus are delayed - the don't drop down instantly. Why?

Brodie kept telling us in online confs that there was no noticeable
slowdown under MultiTOS. Call it poetic license?

>And another question: Is it possible for anyone to write a program, that
>will make the mega-size scrollbars smaller? They have apparently grown
>several pixels with the introduction of 3D-buttons and sliders.

An interesting (and useless) side effect: I found in at least one program
that grabbing and holding the vertical slider, you can wiggle it left and
right in the extra space the 3d effect takes up.

It really irks me that Atari couldn't have released a good graphic/sound
demo on the demo units sent out to dealers. I _know_ they have 'em!
The ONLY good demo I've seen is this CEBIT93 demo, and it's a bit too
crass to be showing indescriminantly in public. Something about the
opening title screen saying "The fucking bitch is dead." turned me off.

> paragon2 - nice static piccy of a road - machine hangs. The graphics
> certainly don't slow down with the sound running - they
> aren't doing anything anyway

Apparently this one is looking to play some sound file. No file, no
sound. It's an advertisement, obviously, so there is no <Q>uit option.
Dumb.

> termfin(?) - TOS error 35, then GEM complains of having no memory until
> I reset.

Definitely requires an SC1224/1435. Seems a data file may be missing?

I'm sure Atari would've kept him forever, if they could've... It's hard
to find good programmers who are willing to use their time to support
people on GEnie.

John's a great guy and it's a serious loss to Atari.

not. It works fine on Run PCs Falcon0303 4/65. It has a NEC 3Dfg hooked to it.
spectacular picture on it... THe only difference is instead of being centered
like on the SC1224/1435, it is more towards the top.

I used to have a program named MIDIX32 (some sort of demo of a shareware program) that would play .MID files through the STs speaker (I used it on a Mega ST2 TOS 1.02). I got it from Abacus BBS in San Francisco (415-587-8062) in the ST Music & MIDI file SIG. I don't know if it's available on aaue. If you email me (hsp4@columbia.edu), I'll get back in touch with you when I have my ST again (it's packed up to get shipped home for the summer)...

```
] WW> So, I can easilly format my disks to over 900K!
]
] Ahem,just a question: is it fast...i've tried it but it seems to me
] VERY slow in 11 sects mode.

No, it's going to be slow, as the ST has to sift through the extra 1k
of data every track. (or an extra 2k over the standard desktop format).

Also, 11-sector formats don't (that I've seen) use twister/skewed sector
formats (e.g. the sectors go 1, 2, 3..10,11, rather than in orders like
6,11,3,5,9,4,10,1,8,2,7 in which case the disk doesn't have to do complete
revolutions to read certain sectors, which can speed up accessing!)

HD drives manage the extra sectors (e.g. 18-sectors per track I think),
by beefing up the drives seek rate, decreasing times required to locate
the data. Amigas don't do this, and so effectively double access time
with HD disks! (Even their DD disks are noticably slower than the ST's!)
```

> to an old PC (still in Uni) then putting them onto disk from there.

The regular UNIX uudecode should work fine. You should delete anything before the begin line (the one the error message mentions), and anything after the end line. This may be what confused your uudecode. If it is in multiple parts, delete mail headers and pipe them into uudecode (or paste them together with an editor). These instructions also apply to all clones of uudecode (ST, PC, Mac, etc.).

An alternative is to use a smarter uudecoder, like uunconc. Uunconc takes the file names of the parts as arguments, and automatically strips mail headers and stuff. It is a UNIX program, but can probably be compiled on the ST as well. If you cannot find the source, I can email you a copy (I suggest using it on the Sun, as it will be faster).

Also, some news readers can uudecode posts automatically (I use tin, which has this capability).

Now, another point: if you ftp'ed the files, are you sure they are uuencoded? The uuencoded format is typically used for mail servers, as uuencoded files are guarenteed to survive a trip through an IBM gateway. They are made up of only visible ASCII characters, and almost always bigger than the file they represent. Thus, they are text files. Take a look at one of your files with a text editor. If it doesn't say "begin filename 644" at the top (or something similar), followed by a bunch of text lines, then it is not uuencoded. You can use the UNIX "file" command to figure out if they are UNIX compressed (usually denoted with a ".Z" ending). If they are, use the UNIX "uncompress" to unpack them. Files ftp'ed from atari.archive.umich.edu are almost always in some sort of ST archive format, and need no special processing. However, they must be ftped in BINARY mode, or they will not work when you get them home.

6721. High speed modem question

Newsgroup: comp.sys.atari.st
Date: 1993-05-09 01:54:30 UTC
From: boyd@gauss
Message-ID: <C6qLAu.HKD@mailer.cc.fsu.edu>
Source record: 206059
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a PPI 9600SA modem, which can do V32/V42bis. My understanding is that, with data compression going, the theoretical maximum speed data can be transmitted or received is 38400 baud. Thus, one's modem program should be set to this speed. If one does not set the modem program speed to be greater than 9600 baud, then no benefit is gained from data compression.

Now, on to my question. The fastest speeds I have attained with my modem (ymodem text download of a large English text file) was about 1100 cps. I am using Uniterm (set at 19200 baud, since this is the fastest the modems on the other end can go), Serial Fix 2.0, and was connected v42bis (data compression and error checking on). This type of file should have made good use of the data compression stuff, so I was expecting to get closer to 2000 cps (if not beyond). My questions are as follows:

1. Was this a reasonable expectation? Am I really losing performance?

2. Is there any advantage to using hs_fix.prg instead of Serial Fix 2.0? I think there is something in the documentation about making serial buffers bigger. Is this where I am losing my performance?

3. How does the cps rating work exactly? I am currently interpreting it to mean "8-bit characters per second", so 9600 baud = 9600 bits per second = 1200 cps (max). Is this correct?

When I download binary files, I get 830-880 cps. The machine is a Mega2ST. Thanks in advance for any comments.

NO its 9600/10, there are 10 bits to every 8 bit data byte..

>When I download binary files, I get 830-880 cps. The machine is a Mega2ST.
>Thanks in advance for any comments.

Using V42bis on compacted data slows things down a lot..

So to get a good throughput with text data you will need a port speed of
4 times 9600, (V42bis has a claimed 4:1 compression ratio with text data) so
thats 38400, I don't think that a standard Atari could even keep up at that
speed, there are Hardware mods to get this port speed, but they are in German,
RSVE1_1.LZH is the file that I am thinking of, but then again can the software
keep up..??

6737. Need help recovering deleted file!

Newsgroup: comp.sys.atari.st
Date: 1993-05-09 16:02:37 UTC
From: zimmermk@westford.ccur.com
Message-ID: <1993May9.160237.2813@westford.ccur.com>
Source record: 206070

Hi. I have an Atari 1040ST with GEM and TOS in ROM (versions from aroung 1985). I've accidentally deleted a file AND overwritten the directory entry. I've found my data using a sector searching program (it's in a nice contiguous block), but I don't know how to make it into a file.
Do you know of either (1) a program that I can get TODAY that will recover this data for me, or (2) an ON-LINE source of documentation that will describe the FAT and clusters? If you do, PLEASE drop me a note at

zimmermk@westford.ccur.com

!
ADVthanksANCE !

I don't know much about TOS internals -- specifically, I don't know what a cluster is exactly, and I don't know the format of the FAT. What I need to do is to be able to create [a?] cluster[s?] in the FAT that will imply that a certain set of sectors is "in-use"; I gather from what documentation I have that the first cluster must be marked "Start", and that the last cluster maybe should point to an "End-of-file" cluster, or something like that, but I'm not sure of the details. If I can do this, then the data will be recognized as an "Orphan" file, and I've got a program that I can use to get it back.

In article <C6qLAu.HKD@mailer.cc.fsu.edu> boyd@math.fsu.edu writes:
>I have a PPI 9600SA modem, which can do V32/V42bis. My understanding is that,
>with data compression going, the theoretical maximum speed data can be
>transmitted or received is 38400 baud. Thus, one's modem program should be set
>to this speed. If one does not set the modem program speed to be greater than
>9600 baud, then no benefit is gained from data compression.

That's correct. However, the theoretical maximum really is
theoretical, it is only achieved on _very_ loosely typed textfiles.
One way is to make a file with say 100KB of the same letter all the
way, that should be the most compressable file.

>Now, on to my question. The fastest speeds I have attained with my modem
>(ymodem text download of a large English text file) was about 1100 cps. I am
>using Uniterm (set at 19200 baud, since this is the fastest the modems on the
>other end can go), Serial Fix 2.0, and was connected v42bis (data compression
>and error checking on). This type of file should have made good use of
>the data compression stuff, so I was expecting to get closer to 2000 cps
>(if not beyond). My questions are as follows:
>
>1. Was this a reasonable expectation? Am I really losing performance?

This was totally normal. The reason for this is that you were using
Y-Modem. Ymodem transmits a checksum after every 1024 bytes, and that
takes processing time. On a slow connection it doesn't show very much,
but on faster connections it really affects the overall performance.

>2. Is there any advantage to using hs_fix.prg instead of Serial Fix 2.0?
> I think there is something in the documentation about making serial buffers

At least not speedwise, I think. However, I have had problems with
Serial Fix 2.0 (and 1.x) when used in conjunction with XYZ.TTP
(version 2.02 beta, and 2.01). Whenever I upload something, XYZ
doesn't seem to detect the end of the file, it just begins
time-outing. I use HS-Fix 1.4 and it works nice.

> bigger. Is this where I am losing my performance?

I really doubt it. I have never had to alter my buffers to gain
performance. I think your problem is Y-modem, in fact I am sure of it
:).

>3. How does the cps rating work exactly? I am currently interpreting it to
> mean "8-bit characters per second", so 9600 baud = 9600 bits per second
> = 1200 cps (max). Is this correct?

That way you only get a _very_ theoretical maximum. If you have an error correcting connection (MNP 3-4 or V.42), then the modems don't use start and stop bits, like on normal non-error-correcting modems, where 10 bits are transferred for every byte (8+start+stopbit). Thus, you would think that you'd get the actual speed by taking 9600/8=1200, but as the error correcting protocol has to re-transmit faulty data due to line noise, and because it has an overhead (it calculates checksums etc), the actual speed is gotten by dividing the BPS rate with a number somewhere between 8 and 10, for me it is a little under 9.

>When I download binary files, I get 830-880 cps. The machine is a Mega2ST.
>Thanks in advance for any comments.

I guess this is normal when using Y-Modem. If I were you, I'd change to Zmodem as soon as possible. Zmodem doesn't need to stop every 1024 bytes, it sends the checksum in the same "packet". Zmodem is much more advanced than Ymodem in every way, you can for example continue to transfer from the middle of a file if you for some reason couldn't transfer the whole file in one go. I use XYZ.TTP, it takes about 24 KB diskspace PFX-packed, and it (version 2.02 beta) can do X, Y and Zmodem, and Ymodem-G also which is even faster than Zmodem (only slightly). I've been satisfied with this utility, but there are many other external protocols for Zmodem as well, and many terminal programs have Zmodem built-in. If you want to use Uniterm, be sure to increase the system buffer (did I get it right?) so that you can run programs. If the system buffer is 0, you will not be able to run any external programs from Uniterm (I think).

The transfer rates you will get with Zmodem are (estimates):

Archived files (.LZH .ZIP .ARC .ZOO .ARJ and some others) ~1100 CPS
Text files ~1900 CPS (depends on textfile and where you download to)
Binary files ~1200-1900 CPS, depending on the specific file.

If you download to a floppy disk, performance will drop quite a lot. Use hard disk or RAM disk for optimal performance. Oh, and you will not get more than ~1920 CPS in any case because the serial port of the ST doesn't go faster than that. It is possible to do some hardware modifications to improve the speed however.

>NO its 9600/10, there are 10 bits to every 8 bit data byte..

That is only the case without error correction, because error
correction makes the connection synchronous and eliminates the
start&stopbits.

>Using V42bis on compacted data slows things down a lot..

It doesn't, it is MNP5 that does that. V.42bis is more intelligent and
hasn't this problem.

>(We have the egg, now we need a chicken....) The only thing I've seen
>come down the pike is MusiCom, and a VERY SLOW TRICKLING of p.d/shareware
>stuff.

It is absolutely wrong to say there is not much new software for the FALCON!

There are MusicCom, D2D, Cubase Audio and some other commercial and shareware
products that take use of the Falcon's sound and DSP abilities. Cubase audio
is THE hit of the Frankfurt Music fair.

There are new programs to use the Falcon's TrueColor (for example for
video titling) - available (I have seen them at the CeBit).

There is professional software to use the DSP for Fastfourier Transform and
as a digital filter in real time (Rhotron Germany - they even have a Falcon
in a tower case with about 10 VME bus slots!).

All other things like MultiTOS, Speedo, Works and all good GEM applications
work and take use of the Falcons 16 & 256 color modes. Works is able to
play sounds in it's text files for example on the Falcon.

There is Black Mail, the voice mailing system ported from the NeXT
computer.

Certainly there are many other things - I posted the list shortly after the
CeBit already. The only thing I'm missing (well not REALLY missing) is
the first FALCON only game ;-)

If one thinks about that there are only some 10 thousands FALCONs out there
then one can say there is already a lot of software available for it.
Just compare it with the 2 million sold OS2 copies: There is really very few
software available that is written for OS2 2.0 really...

The old ST programs don't work on the Falcon. But it's very easy
to switch from 60Hz PAL/NTSC to 50HZ PAL on a RGB monitor. But that is still
something different when a VGA monitor is connected.

] Using V42bis on compacted data slows things down a lot..

Not really, using V42bis causes virtually no-slowdown whatsoever on uncompressable data. MNP-5 slows things down a lot however!

I have my modem software set at 19200 with RTS/CTS flow control turned on, and the modem connected at 9600, I usually get around 1100 when I'm uploading or downloading! (I only use v42 not v42bis, as it doesn't work too well with my setup!)

6744. Lexicore Vs. Cybercube (The GEMVIEW STORY)

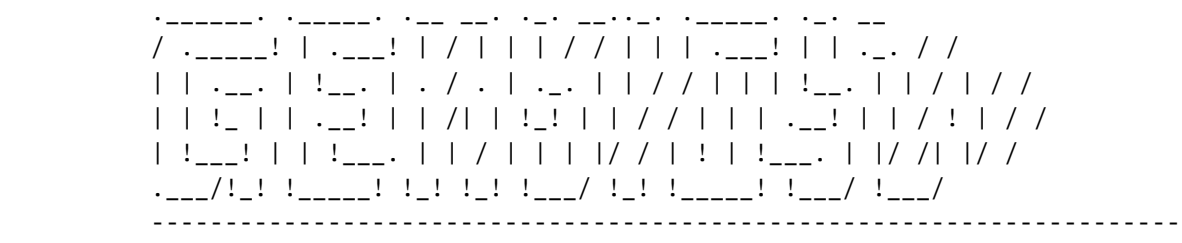
Newsgroup: comp.sys.atari.st
Date: 1993-05-09 21:01:40 UTC
From: drnibble@parrot.WPI.EDU
Message-ID: <1sjrfk$fti@bigboote.WPI.EDU>
Source record: 206080

As some of you might have heard many News and Rumours have been spread
through GENIE Atari BBS that Lexicor Software apparently claimed to have
acquired distribution rights for GEM-View. This is correct ONLY ABIDING TO
THE SHAREWARE RULES. ANy other accusations or messages by anyone else stating
otherwise I would like to see that evidence. Cybercube has started those false
accusations and have also falsely claimed to be themselves exclusive distributors
of the program GEM-View. However this is INCORRECT, Dieter has allowed both CYbercube
and Lexicor to freely distribute GEM-View as a SHAREWARE PRODUCT in NORTH AMERICA.
Lexicor Software has not broken ANY of the deals and agreements made with Mr. Dieter
Fiebelkorn who's honesty and hard work is truly being hampered with illegitimately
by Cyber Cube.

Please read this...a direct copy from GEnie, a claim made by Cybercube!

Category 7, Topic 33
Message 39 Fri May 07, 1993
CYBERCUBE (Ralf) at 18:25 EDT

****
---------- OFFICIAL ANNOUNCEMENT ----------
N E W D I S T R I B U T O R F O R



Cybercube Research Limited, Canada has acquired the exclusive rights
to distribute Dieter Fiebelkorn's GEM-View in North America.
Effective immediately, Cybercube Research Ltd. will solely handle all
customer support, registration, upgrade and marketing related issues.
The existing versions of GEM-View will remain SHAREWARE while the new
versions will only be available as a COMMERCIAL product.
For more information about our extensive upgrade policy, a full list
of the new and extended features, the next release or pricing simply
refer to our upcoming GEM-View press releases.
If you have any additional questions, please send your e-mail to
CYBERCUBE or contact us at:
Cybercube Research Limited
126 Grenadier Crescent
Thornhill, Ontario,
Canada, L4J 7V7
Tel. (416) 882 0294

Fax (416) 886 3261
BBS (416) 882 5895
GEnie CYBERCUBE
We would like to thank all GEM-View users for their continued support
and look forward to a exciting and new co-operation.
****

The above statement clearly shows that it was CYbercube who has made the false statement. According to Dieter Fiebelkorn there are NO exclusive rights to his SHAREWARE program or future to be released COMMERCIAL version.

I believe Cyber Cube owes Dieter Fiebelkorn a true apology for his over-statements.

all replies to drnibble@wpi.wpi.edu

Xenomoph-3D (Phoenix 512 U.S.A.) by Lexicor Software Corp.
*****this article is in German*******

Inzwischen gibt es schon einige 3D Rendering und Raytracing Programme wie
z.b. Lexicor Software's 3D Paket Phase-4. Der 3D Raytracer, Render 24 das im
Paket beinhaltet war, ist jedoch sehr sehr langsam. So konnte man zwar noch
immer besonderes schM-^Tne Animationen mit Chronos-3D machen, wer sie aber in
Photorealistischer QualitM-^Dt produzieren wollte (24 bit) muM-^^te bereit sein seinen
Atari Computer fM-^Ar Tage wenn nicht Wochen rechnen zu lassen denn fM-^Ar eine
brauchbare Animation dauert es nun mal sehr lange, ganz besonderes mit Render
24. Im Atari Sektor gibt es inzwischen 3D Editors und auch andere Raytracer
wie GFA Raytrace oder Inshape. Jedoch haben keine dieser Programme
besondere "Texture Mapping Features" und laufen auch nicht auf jeden Atari
problemlos.
Phoenix 512
Phoenix 512 ist ein solches Program das sehr schnell rendern kann, problemlos
auf jeden Atari lM-^Duft und unterstM-^Azt, sogar den Falcon und einzigartige "Texture
Mapping Features" hat. Zudem ist es voll kompatible zur Cyber Serie und ein
Produkt von Lexicor Software was bedeuten wM-^Arde das es auch voll kompatible
zur Phase-4 Serie ist. Im moment kann man nur Cyber Sculpt 3D2 bilder oder
RD1 (Phoenix Format) als 3D Format verwenden aber in kM-^Arze wird es auch
ANM files laden kM-^Tnnen. Das bedeutet das man in Chronos erzeugte Animationen
in Phoenix 512 rendern kann.
Formate
Das Program verwendet 3D2 (Cyber Format) Bilder, CTL (Cyber Control) und das
hauseigene RD1 als 3D Format. RD1 ist der einzige 3D Output file. Wenn man in
RD1 abspeichert, speichert man die gesamte Phoenix einstellung fM-^Ar dieses
Objekt(e) wie zb. Beleuchtung, OberflM-^Dche, Kamera einstellung usw. Die Leute die
noch Cyber Control verwenden kM-^Tnnen nun ihre Animationen durch Phoenix
errechnen lassen und somit ihre 3D Animationen auf jede AuflM-^Tsung errechnen
lassen, sei es nun ST, TT oder Falcon da Cyber Control selbst nur die ST
AuflM-^Tsungen unterstM-^Azte.
Als End Format unterstM-^Atzt Phoenix das Spektrum Format d.h. das es auf einem
normalen ST bis zu 512 Farben gleichzeitig Rendern kann und auf einen STE
unterstM-^Azt er automatisch die erweiterte 4096 Farben. AuM-^^erdem unterstM-^Azt
Phoenix noch GIF und Targa files. So kann man Einzelbilder als GIF, Targa oder
SPC file abspeichern und anschauen. Phoenix 512 unterstM-^Azt bis zu 16,7 Millionen
Farben gleichzeitig, jede VDI freundliche Karte sollte darauf laufen ohne
Probleme.
Texture Mapping
Texture Mapping bedeutet soviel wie OberflM-^Dchen belegegung. Man kann jetzt in
Phoenix 512 eine Marmor oder Holz OberflM-^Dche definieren und diese dann in
einem 3D Objekt als OberflM-^Dche zugeben. Es gibt optionen wie grain perturbation

und color pertubation mit denen man die Art der verbreitung der Farben eingeben kann so das man frei definierbare Marmor oder Holz OberflM-^Dchen geben kann. Das ganz besondere Texture Mapping feature von Phoenix 512 ist aber das Image Mapping. Mit Image Mapping kann ich meine eigene OberflM-^Dche creieren und verwenden z.b. ich hole mir irgendein Bild, digitalisiere es in Farbe (oder SW), speichere es als GIF (Graphics Interchange Format von Compuserve Inc.), Targa (AT&T true colour files) oder SPC (Spektrum file) format und verwende es in Phoenix als eine regulM-^Dre OberflM-^Dche. So kann ich die frei defienierte OberflM-^Dche bespiegeln lassen, flach aufsetzten oder auch auf dem 3D Objekt umwickeln. Somit kann ich jedes x-beliebige Farbblid als OberflM-^Dche verwenden. Dieses Farbbild kann ich dann noch auf eine andere OberflM-^Dche bespiegeln lassen.

KompatibilitM-^Dt und AuflM-^Tsung

Phoenix 512 lM-^Duft problemlos auf jedem Atari Computer und kann auf jede x-beliebige Atari AuflM-^Tsung Rendern und Raytracen. Besonders praktisch ist das Phoenix auch den Mathematischen Co-prozessor unterstM-^Azt so fern man so etwas hat. Man kann in Phoenix einstellen auf welchen Format er Rendern soll z.b. kann ich auf einen TT im Falcon Format rendern und umgekehrt. Zwar kann ich auf einem TT nicht die gleichen Farben kriegen und deshalb auch nicht ur-plM-^Ttzlich ein Falcon Bild auf einem normal-TT hinzaubern aber wenn man bedenkt das ein TT SerienmM-^DM-^^ig mit Co-prozessor kommt und noch dazu doppelt soviel Mhz hat wie ein Falcon dann kann es doch ganz praktisch werden. So kann ich Falcon Animationen auf einem TT machen in 4 facher geschwindigkeit, und ich kann mit Phoenix schon jetzt Falcon Demo's machen ohne das ich einen Falcon habe.

Raytracing & Rendering

Phoenix erstellt seine Bilder im sogenannten Raytracing verfahren. Man kann in Phoenix einstellen in welcher QualitM-^Dt und in welcher AuflM-^Tsung (und farb palette) er Rendern soll. So hat man die wahl ob man jetzt in Polygon/Flat, Goraud, Phong oder in Phong/Shadow Rendern soll. Polygon ist die einfachste Schattierung, natM-^Arlich ist die berechnungszeit sehr schnell fM-^Ar Bilder die im Polygon Schattiert werden. Phong ist die feinste Schattierung, Phong/Shadow wirft zusM-^Dtzlich noch einen Schattenbild. Die Berechnungszeiten im Phong/Shadow Modus kann aber Stunden dauern, das fertige Resultat ist jedoch sehr eindrucksvoll.

Animation

Mit Phoenix kann man Animationen machen nach dem man die notwendige 3D Objekte geladen hat und dementsprechend bearbeitet hat. Wenn nun jedes Objekt die entsprechende OberflM-^Dche hat, die Beleuchtung stimmt und die Kamera einstellung korrekt ist, kann man seine Animation aufnehmen. Phoenix 512 kann zur Zeit Einzelbilder errechnen und diese dann in einem Gesamt Format abspeichern. Phoenix unterstM-^Azt eine elementare form des Key-frame-animation. Es erlaubt die eingabe von der Kamera (oder Objekt) position der ersten und des letzten Frames. Danach gibt man ein wie viele Frames man fM-^Ar diese animation braucht und fertig ist die Animations information. Z.b. ich habe ein 3D Objekt und will das die Kamera sich um 60 horizontale grade um das Objekt bewegt. Also stelle ich die Kamera beim ersten Frame auf 0 grad und beim letzten Frame auf 60 grad und der Computer berechnet die Zwischenframes schon fM-^Ar mich.

Wenn der Computer nun die Animation Daten hat dann speichert er sie in ein

PA1 file ab das die notwendige Bildinformation liefert fM-^Ar den Key-frame wenn Phoenix die einzelnen Bilder berechnet.
Phoenix kann im moment noch nicht in einem Gesamtformat abspeichern. Im moment werden nur Einzelbilder abgespeichert und numeriert (z.b. Anim1.Gif, Anim2.Gif usw.). Danach kann man die Animation im mitgelieferten GIF to VDO Converter Program zu einer Gesamt Animation zusammenbauen und diese dann mit dem Program VDO Player, der auch im Paket beinhaltet ist, abspielen.
Zurzeit befindet sich aber dieses VDO Format noch in der M-^^eta Phase, die derzeitige Version vom VDO Player machen da noch etwas schwierigkeiten beim abspielen der animation z.b. funktioniert sie derzeit nur in TTlow. Wer Prism Paint besitzt kann die einzelnen Gif's auch in Prism Paint reinladen und zu einer Komplett Animation bauen. Da es aber manchmal verschiedene Paletten per Frame gibt wird es nicht fM-^Ar die ganze Animation reichen da Prism Paint im FLM Format keine Einzelne Palette information pro Bild hat. So sind die ersten 10 Frames in einer Palette, die nM-^Dchsten 10 in einer anderen. Daher wird an ein neues Malprogram gearbeitet das daM-^^ VDO Format lesen kann und Single-Palette per frame hat (Einzelne Palette information pro Bild).
FM-^Ar die Zukunft
Ende JM-^Dnner sollte Phoenix komplett Phase-4 Kompatible sein. Es kann dann mit Chronos erstellte ANM files lesen und im VDO Film Format abspeichern, d.h. das man dann auch alle 3D Objekte in der Chronos Animation neu EinfM-^Drben und neue OberflM-^Dchen geben kann. Wenn die neuen angekM-^Andigten Produkte von Lexicor Software fertig sind (Mona Lisa, ein 24 Bit Mal & Animations Program, Meridian, ein 3D 24 Bit Mal & Animations Program) dann kann man mit Phoenix ordentliche Animationen in jeder AuflM-^Tsung erstellen. Es ist zwar im moment noch nicht geplant aber es wM-^Dre sicher sehr praktisch wenn Phoenix 512 den Falcon komplett unterstM-^Azten wM-^Arde d.h. nicht nur Grafik Modi sondern auch den DSP. Dann wM-^Dre das Raytracen mindestens doppelt so schnell wie als auf einem TT. Das macht das Arbeiten auf dem Falcon noch sinnvoller. Im moment wM-^Dre nur die verbesserte Grafik AuflM-^Tsungen und die Output Hardware (VGA, RGB und normales HF Signal) vom Falcon das Argument auf einem Falcon 3D Rendering und Raytracing zu machen. Es ist also zu hoffen das Phoenix 512 oder irgend welche Software in der Richtung in Zukunft den DSP unterstM-^Azten wM-^Arden.
Fazit
Phoenix 512 ist in der derzeitigen Version ein sehr gutes Program. An dem Program wird es noch einige verbesserungen geben die ich vorher beschrieben habe. Insgesamt macht Phoenix einen sehr kompletten Eindruck. Die Leistung die dieses Program bringt ist sehr gut, man kann sehr schM-^Tne & eindrucksvolle Fotorealistische Bilder & Animationen erstellen auf jeden Atari. Das User-Interface (BedienungsoberflM-^Dche) ist M-^Abersichtlich und einfach zu bedienen. Richtig interessant fM-^Ar Chronos-3D Anwender wird es aber erst wenn es ANM (Chronos Animation file) Kompatible sein wird.
Wer Phase-4 schon hat wird versichert das es Chronos ANM file Kompatible sein wird. In der jetzigen Version ist es aber noch immer sehr nM-^Atzlich insbesonderes die Texture Mapping Features und das schnelle Rendering.
FM-^Ar Leute die noch keinen einzigen 3D Animations Paket haben werden Phoenix als Einsteigerpaket sicher sehr gut finden. FM-^Ar AS 960 kriegt man Phoenix 512 mit Cybersculpt (Den 3D Editor von Antic) und ein paar System Utilities die sehr nM-^Atzlich sind fM-^Ar den Phoenix Anwender. Das Handbuch ist in English, das

dM-^Arfte aber keine groM-^^e HM-^Arde sein fM-^Ar den ernsthaften Anwender, ganz besonders nicht fM-^Ar diesen M-^DuM-^^erst gM-^Anstigen Preis. Aber selbst fM-^Ar den einfachen
Hobbyanwender ist dieses Program sehr nM-^Atzlich da es fM-^Ar jedermann erschwinglich ist. Zudem macht es einfach spaM-^^ mit diesen Program zu arbeiten.
Wer also schon immer 3D Fotorealistische Bilder, Key-frame animation auf seinen ST/STE/TT oder bald Falcon (wenn er endlich verkauft wird!) erstellen wollte aber immer abgeschreckt wurde weil der Preis fM-^Ar normale & gM-^Dngige Raytracer und 3D Keyframe Animators zu kostspielig erschien, dann ist er mit Phoenix 512 bestens bedient.
FM-^Ar diesen Preis kann ich das Program nur wM-^Drmstens empfehlen.

6746. CeBIT Report from Lexicor Software

Newsgroup: comp.sys.atari.st
Date: 1993-05-09 21:27:15 UTC
From: drnibble@parrot.WPI.EDU

Lexicor Software Corporation, EUROPA
Cottagegasse 69
A-1190 Vienna
AUSTRIA
Tel: (222) 36 75 92
Fax: (222) 36 91 787
CEBIT Report from Yat Siu
Hi
As European Representative of Lexicor Software and as the only Lexicor member present at the CeBIT I make this report available for everybody in the US and especially for all the Lexicor Users.
CeBIT was again an amazing spektacle as always boasting to host over 650,000 visitors this year. The CeBIT is the Number 1 Computer Fair in the whole of Europe, to think that it is a purely German thing is quite wrong. There were people from the North America, Middle East, Far East even Africa and South America, the Eastern Bloc Countries etc. now to the Atari Part.
In comparison to the previous years Atari has suffered, as expected, a dramatic set back. However, Atari has covered it up well, the stand was still quite large and impressive. The previous year has about 116 full stands....this year only 60 or so. But Atari have made it so that the actual stand was still as big as the previous years, they made the actual Atari Club House smaller and doubled the size of the actual stands than last year, for most displayers...we were one of the Lucky ones :) our stand (nr.11 and 13) happened to be one of the biggest ones! There were no ST's or Mega's, only Falcon and TT's. Atari like the year before had a huge presentation stand where it displayed multimedia, sound and animations (Overscan Animations and Hardware + Lexicor Animations) on a very large video monitor (if i recall about 8 * 6 Montitors of 17" each glued together to make one gargantuos monster f____r monitor.
Lexicor Software Stand and Richter Distributor
This Stand (our stand) Had 2 Falcon's, 2 TT's, 1 Atari SC1435 Monitor (cough, cough), 2 PTC1426, 1 21" Eizoscreen Multisync Monitor and 1 Atari TT High Rez Monitor. 3 Computers were constantly presenting 3D Rendering and Animations, and one demonstrated the new GFA Basic and Castell, an architecture Program. We showed off Xenomorph, Chronos-3D, Prism Paint, Meridian and generally Phase-4. The response was very good. Everybody loved Xenomorph (Phoenix U.S.A.), there were many questions asked about Chronos and how Xenomorph and Chronos would link up. We were promised excellent Press...in ST Computer, ST Magazin, ST Magazin (France), TOS, ST Nieuws (Hungarian I think?). We were the only ones showing moving Animations on the Falcon and TT with the Nova Graphics Board (we used 640*480 in 256 and 32k colours). Lexicor Software Products all ran perfectly on the NOVA VME Card (Chronos-3D (v.1.31), Prism Paint, Xenomorph, Genesis, Cyber Color, Prism Render 24 etc. tools) however in Chronos you could

create an animation but the v.1.31 wuold not identify the Nova resolutios....yet. Richter also showed TELL-IT, an answering phone system for Atari's and a Falcon Speedup making the Falcon030 boost up from 16 to 36MHZ and have a 50MHz FPU included turning the Falcon into a true Power Horse. Especially useful for increasing Rendering Speeds. Richter also showed a memory expansion board which only cost 30 dollars....but it required soldering to put the SIMMS on board.

GeSOFT

Displayed their memory expansion for the Falcon...driven by an own processor this RAM is faster than TT Fastram and comes in an external case for the Falcon.

OMIKRON

Displayed their new Painting Program PIXART and a very innovative and intuitive design for a database called Freeway which enables you to set your own path eg. in our case. Freeway would execute the Player Program by Lexicor Software and show the animation with the name given in the Freeway Database, so I just need to click on a theme (self-defined) eg. Skeleton and it will load the Skeleton Animation upon clicking it.

Brainstorm

They presented the most interesting DSP stuff on this years show surprising everyone with their MPEG Player which may prove very interesting for Multimedia. Using the DSP to decompact it could play true colour upto 12 frames a second without the Richter Speedup. They also had a Jpeg Viewer and FLI Players.

DOA

Being the only other US Company present aside from us displayed a Telephone System for the Falcon Computer.

Steinberg

Pretty obviously they showed everybody their newest MIDI stuff on the Falcon.

DDD

They showed a Falcon030 in an external casing, but apart from the external that was it, a VME would have been nice.

TradeIT

They showed off Digitape (a digital tapemaster....basically turning your Falcon into a 4 track) for the Falcon and Chagall, a Powerful Paint and Retousching tool for both Falcon, TT and any other VDI Graphics Card such as the Crazy Dots.

Overscan

Presented their Genlock for the Falcon and Overlay, a pimitive but easy to use 2D Animation and Video Display Set up. Their Genlock was shown at the actual big presentation stand. Overscan presented pretty much Multimedia on the Falcon, at a very basic level, includiogn their Falcon Screen Blaster.

TKR

As the year before TKR presented their Telecommunications Hardware and Software including their Crazy Dots Card which can do 8 bit, 15 bit and now even 24 bit Palette (There will be an NVDI for the 24 bit version according to TKR), in resolutions from 640*400 till upto 1664*1280. TKR is one of the leading graphics card developers in German with literally thousands of Cards sold. The support for this system is truly amazing. (Xenomorph (Phoenix U.S.A.), Prism Paint, Cyber Color and the unreleased version of CHRONOS works on it).

MATRIX

And yet another Graphics Hardware leader in the Atari Market. While the Crazy Dots sold their 8 bit systems quite well, Matrix has sold a couple hundred if not thousand of their 24 bit Card (and several thousands of their 8 bit card). The

TC1208 is a masterpiece of a card and in Europe well-respected to be the best Graphics Card around for the VME bus. With virtual resolution up to (actual max: 1280*1024) 4608*3600 in mono, 1634*1280 in 256, 1152*896 (actual resoultion) in 16 bit and 832 * 624 in 24 bit (2 Mb RAM) this card is a true masterpiece, very quick VDI's and beautiful tools like a Mega Fast Zoom option. It is a 32 Mhz (TMS 34020) with the ability to digitize in real time with the MAT DIGI Card which also runs on the Falcon030. I am glad to announce that Xenomorph (Phoenix U.S.A.), Cyber Color and Prism Paint run on all the Matrix Cards.

ASH

One of the most prominent Atari Programmers, they showed their applicatios such as Pure C, Pure Pascal (OOP) and Phoenix database.

H3 Systems

They showed off DA's Vektor which is a very pretty and useful vektor oriented Drawing Program. Now it uses 3D Functios and produces pseudo 3D Effects but it is not really 3D, more 2D. DA's Vektor is a very powerful drawing tool in general. There have been a lot more than just that, however I cannot go into so much depth about everything. I will post some more CeBIT news if requested, however until now, that is all about CeBIT I will post. Atari may be not doing as great as it did 2 years back, but it is far from dead, at least in Germany so.

6747. 8bit emulation???

Newsgroup: comp.sys.atari.st
Date: 1993-05-09 21:27:17 UTC
From: gcl3@cunixb.cc.columbia.edu
Message-ID: <1993May9.212717.262@news.columbia.edu>
Source record: 206086

Does anyone out there in Atariland know if I can emulate an 8bit with my ST
or emulate either or both with an IBM??

I have some early versions of the ST Xformer which run hardly anything at all
and what they do run (mostly BASIC programs) they run at slower than a
snail's pace.

Greg Langmead
gcl3@cunixb.cc.columbia.edu

6748. Xenomorph-3D Artikel in German (C) Lexicor Software

Newsgroup: comp.sys.atari.st
Date: 1993-05-09 21:30:11 UTC
From: drnibble@parrot.WPI.EDU
Message-ID: <1sjt53$gfb@bigboote.WPI.EDU>
Source record: 206084

Any replies to drnibble@wpi.wpi.edu, German file on XENOMORPH 3D XEST ARTIKLE.

XENOMORPH-3D (Phoenix 512 U.S.A.)

Inzwischen gibt es schon einige 3D Rendering und Raytracing Programme wie
z.b. Lexicor Software's 3D Paket Phase-4. Der 3D Raytracer, Render 24 das im
Paket beinhaltet war, ist jedoch sehr sehr langsam. So konnte man zwar noch
immer besonderes schM-^Tne Animationen mit Chronos-3D machen, wer sie aber in
Photorealistischer QualitM-^Dt produzieren wollte (24 bit) muM-^^te bereit sein seinen
Atari Computer fM-^Ar Tage wenn nicht Wochen rechnen zu lassen denn fM-^Ar eine
brauchbare Animation dauert es nun mal sehr lange, ganz besonderes mit Render
24. Im Atari Sektor gibt es inzwischen 3D Editors und auch andere Raytracer
wie GFA Raytrace oder Inshape. Jedoch haben keine dieser Programme
besondere "Texture Mapping Features" und laufen auch nicht auf jeden Atari
problemlos.
Phoenix 512
Phoenix 512 ist ein solches Program das sehr schnell rendern kann, problemlos
auf jeden Atari lM-^Duft und unterstM-^Azt, sogar den Falcon und einzigartige "Texture
Mapping Features" hat. Zudem ist es voll kompatible zur Cyber Serie und ein
Produkt von Lexicor Software was bedeuten wM-^Arde das es auch voll kompatible
zur Phase-4 Serie ist. Im moment kann man nur Cyber Sculpt 3D2 bilder oder
RD1 (Phoenix Format) als 3D Format verwenden aber in kM-^Arze wird es auch
ANM files laden kM-^Tnnen. Das bedeutet das man in Chronos erzeugte Animationen
in Phoenix 512 rendern kann.
Formate
Das Program verwendet 3D2 (Cyber Format) Bilder, CTL (Cyber Control) und das
hauseigene RD1 als 3D Format. RD1 ist der einzige 3D Output file. Wenn man in
RD1 abspeichert, speichert man die gesamte Phoenix einstellung fM-^Ar dieses
Objekt(e) wie zb. Beleuchtung, OberflM-^Dche, Kamera einstellung usw. Die Leute die
noch Cyber Control verwenden kM-^Tnnen nun ihre Animationen durch Phoenix
errechnen lassen und somit ihre 3D Animationen auf jede AuflM-^Tsung errechnen
lassen, sei es nun ST, TT oder Falcon da Cyber Control selbst nur die ST
AuflM-^Tsungen unterstM-^Azte.
Als End Format unterstM-^Atzt Phoenix das Spektrum Format d.h. das es auf einem
normalen ST bis zu 512 Farben gleichzeitig Rendern kann und auf einen STE
unterstM-^Azt er automatisch die erweiterte 4096 Farben. AuM-^^erdem unterstM-^Azt
Phoenix noch GIF und Targa files. So kann man Einzelbilder als GIF, Targa oder
SPC file abspeichern und anschauen. Phoenix 512 unterstM-^Azt bis zu 16,7 Millionen
Farben gleichzeitig, jede VDI freundliche Karte sollte darauf laufen ohne
Probleme.
Texture Mapping
Texture Mapping bedeutet soviel wie OberflM-^Dchen belegegung. Man kann jetzt in
Phoenix 512 eine Marmor oder Holz OberflM-^Dche definieren und diese dann in
einem 3D Objekt als OberflM-^Dche zugeben. Es gibt optionen wie grain perturbation
und color pertubation mit denen man die Art der verbreitung der Farben

eingeben kann so das man frei definierbare Marmor oder Holz OberflM-^Dchen geben kann. Das ganz besondere Texture Mapping feature von Phoenix 512 ist aber das Image Mapping. Mit Image Mapping kann ich meine eigene OberflM-^Dche creieren und verwenden z.b. ich hole mir irgendein Bild, digitalisiere es in Farbe (oder SW), speichere es als GIF (Graphics Interchange Format von Compuserve Inc.), Targa (AT&T true colour files) oder SPC (Spektrum file) format und verwende es in Phoenix als eine regulM-^Dre OberflM-^Dche. So kann ich die frei defienierte OberflM-^Dche bespiegeln lassen, flach aufsetzten oder auch auf dem 3D Objekt umwickeln. Somit kann ich jedes x-beliebige Farbblid als OberflM-^Dche verwenden. Dieses Farbbild kann ich dann noch auf eine andere OberflM-^Dche bespiegeln lassen.

KompatibilitM-^Dt und AuflM-^Tsung

Phoenix 512 lM-^Duft problemlos auf jedem Atari Computer und kann auf jede x-beliebige Atari AuflM-^Tsung Rendern und Raytracen. Besonders praktisch ist das Phoenix auch den Mathematischen Co-prozessor unterstM-^Azt so fern man so etwas hat. Man kann in Phoenix einstellen auf welchen Format er Rendern soll z.b. kann ich auf einen TT im Falcon Format rendern und umgekehrt. Zwar kann ich auf einem TT nicht die gleichen Farben kriegen und deshalb auch nicht ur-plM-^Ttzlich ein Falcon Bild auf einem normal-TT hinzaubern aber wenn man bedenkt das ein TT SerienmM-^DM-^^ig mit Co-prozessor kommt und noch dazu doppelt soviel Mhz hat wie ein Falcon dann kann es doch ganz praktisch werden. So kann ich Falcon Animationen auf einem TT machen in 4 facher geschwindigkeit, und ich kann mit Phoenix schon jetzt Falcon Demo's machen ohne das ich einen Falcon habe.

Raytracing & Rendering

Phoenix erstellt seine Bilder im sogenannten Raytracing verfahren. Man kann in Phoenix einstellen in welcher QualitM-^Dt und in welcher AuflM-^Tsung (und farb palette) er Rendern soll. So hat man die wahl ob man jetzt in Polygon/Flat, Goraud, Phong oder in Phong/Shadow Rendern soll. Polygon ist die einfachste Schattierung, natM-^Arlich ist die berechnungszeit sehr schnell fM-^Ar Bilder die im Polygon Schattiert werden. Phong ist die feinste Schattierung, Phong/Shadow wirft zusM-^Dtzlich noch einen Schattenbild. Die Berechnungszeiten im Phong/Shadow Modus kann aber Stunden dauern, das fertige Resultat ist jedoch sehr eindrucksvoll.

Animation

Mit Phoenix kann man Animationen machen nach dem man die notwendige 3D Objekte geladen hat und dementsprechend bearbeitet hat. Wenn nun jedes Objekt die entsprechende OberflM-^Dche hat, die Beleuchtung stimmt und die Kamera einstellung korrekt ist, kann man seine Animation aufnehmen. Phoenix 512 kann zur Zeit Einzelbilder errechnen und diese dann in einem Gesamt Format abspeichern. Phoenix unterstM-^Azt eine elementare form des Key-frame-animation. Es erlaubt die eingabe von der Kamera (oder Objekt) position der ersten und des letzten Frames. Danach gibt man ein wie viele Frames man fM-^Ar diese animation braucht und fertig ist die Animations information. Z.b. ich habe ein 3D Objekt und will das die Kamera sich um 60 horizontale grade um das Objekt bewegt. Also stelle ich die Kamera beim ersten Frame auf 0 grad und beim letzten Frame auf 60 grad und der Computer berechnet die Zwischenframes schon fM-^Ar mich.

Wenn der Computer nun die Animation Daten hat dann speichert er sie in ein PA1 file ab das die notwendige Bildinformation liefert fM-^Ar den Key-frame wenn

Phoenix die einzelnen Bilder berechnet.
Phoenix kann im moment noch nicht in einem Gesamtformat abspeichern. Im moment werden nur Einzelbilder abgespeichert und numeriert (z.b. Anim1.Gif, Anim2.Gif usw.). Danach kann man die Animation im mitgelieferten GIF to VDO Converter Program zu einer Gesamt Animation zusammenbauen und diese dann mit dem Program VDO Player, der auch im Paket beinhaltet ist, abspielen. Zurzeit befindet sich aber dieses VDO Format noch in der M-^^eta Phase, die derzeitige Version vom VDO Player machen da noch etwas schwierigkeiten beim abspielen der animation z.b. funktioniert sie derzeit nur in TTlow. Wer Prism Paint besitzt kann die einzelnen Gif's auch in Prism Paint reinladen und zu einer Komplett Animation bauen. Da es aber manchmal verschiedene Paletten per Frame gibt wird es nicht fM-^Ar die ganze Animation reichen da Prism Paint im FLM Format keine Einzelne Palette information pro Bild hat. So sind die ersten 10 Frames in einer Palette, die nM-^Dchsten 10 in einer anderen. Daher wird an ein neues Malprogram gearbeitet das daM-^^ VDO Format lesen kann und Single-Palette per frame hat (Einzelne Palette information pro Bild).
FM-^Ar die Zukunft
Ende JM-^Dnner sollte Phoenix komplett Phase-4 Kompatible sein. Es kann dann mit Chronos erstellte ANM files lesen und im VDO Film Format abspeichern, d.h. das man dann auch alle 3D Objekte in der Chronos Animation neu EinfM-^Drben und neue OberflM-^Dchen geben kann. Wenn die neuen angekM-^Andigten Produkte von Lexicor Software fertig sind (Mona Lisa, ein 24 Bit Mal & Animations Program, Meridian, ein 3D 24 Bit Mal & Animations Program) dann kann man mit Phoenix ordentliche Animationen in jeder AuflM-^Tsung erstellen. Es ist zwar im moment noch nicht geplant aber es wM-^Dre sicher sehr praktisch wenn Phoenix 512 den Falcon komplett unterstM-^Azten wM-^Arde d.h. nicht nur Grafik Modi sondern auch den DSP. Dann wM-^Dre das Raytracen mindestens doppelt so schnell wie als auf einem TT. Das macht das Arbeiten auf dem Falcon noch sinnvoller. Im moment wM-^Dre nur die verbesserte Grafik AuflM-^Tsungen und die Output Hardware (VGA, RGB und normales HF Signal) vom Falcon das Argument auf einem Falcon 3D Rendering und Raytracing zu machen. Es ist also zu hoffen das Phoenix 512 oder irgend welche Software in der Richtung in Zukunft den DSP unterstM-^Azten wM-^Arden.
Fazit
Phoenix 512 ist in der derzeitigen Version ein sehr gutes Program. An dem Program wird es noch einige verbesserungen geben die ich vorher beschrieben habe. Insgesamt macht Phoenix einen sehr kompletten Eindruck. Die Leistung die dieses Program bringt ist sehr gut, man kann sehr schM-^Tne & eindrucksvolle Fotorealistische Bilder & Animationen erstellen auf jeden Atari. Das User-Interface (BedienungsoberflM-^Dche) ist M-^Abersichtlich und einfach zu bedienen. Richtig interessant fM-^Ar Chronos-3D Anwender wird es aber erst wenn es ANM (Chronos Animation file) Kompatible sein wird.
Wer Phase-4 schon hat wird versichert das es Chronos ANM file Kompatible sein wird. In der jetzigen Version ist es aber noch immer sehr nM-^Atzlich insbesonderes die Texture Mapping Features und das schnelle Rendering.
FM-^Ar Leute die noch keinen einzigen 3D Animations Paket haben werden Phoenix als Einsteigerpaket sicher sehr gut finden. FM-^Ar AS 960 kriegt man Phoenix 512 mit Cybersculpt (Den 3D Editor von Antic) und ein paar System Utilities die sehr nM-^Atzlich sind fM-^Ar den Phoenix Anwender. Das Handbuch ist in English, das dM-^Arfte aber keine groM-^^e HM-^Arde sein fM-^Ar den ernsthaften Anwender, ganz

besonders nicht fM-^Ar diesen M-^DuM-^^erst gM-^Anstigen Preis. Aber selbst fM-^Ar den einfachen
Hobbyanwender ist dieses Program sehr nM-^Atzlich da es fM-^Ar jedermann erschwinglich ist. Zudem macht es einfach spaM-^^ mit diesen Program zu arbeiten.
Wer also schon immer 3D Fotorealistische Bilder, Key-frame animation auf seinen ST/STE/TT oder bald Falcon (wenn er endlich verkauft wird!) erstellen wollte aber immer abgeschreckt wurde weil der Preis fM-^Ar normale & gM-^Dngige Raytracer und 3D Keyframe Animators zu kostspielig erschien, dann ist er mit Phoenix 512 bestens bedient.
FM-^Ar diesen Preis kann ich das Program nur wM-^Drmstens empfehlen.

6749. PHASE-4 by Lexicor Software in German

Newsgroup: comp.sys.atari.st
Date: 1993-05-09 21:32:57 UTC
From: drnibble@parrot.WPI.EDU
Message-ID: <1sjta9$giu@bigboote.WPI.EDU>
Source record: 206085

Any replies to drnibble@wpi.wpi.edu, this artikle is in German about the Phase-4 Animation Series by Lexicor Software Corporation.

3D-Animation, Raytracing und Rendering war fM-^Ar viele ST/TT User ein traum. Es gab zwar lange fM-^Ar den ST Antic's Cyber-Series die 3D-Animation ermM-^Tglichte (mit viel umstand), oder das bekannte GFA-Raytracer,
aber man brauchte nur einmal ein blick auf die Konkurrenz werfen und schon
wollte man sich verstecken und nie wieder das wort "Raytracing" oder "Rendering" aussprechen. Klarerweise war der ST mit seinen 512 Farben nicht gerade M-^Appig dafM-^Ar ausgestattet worden, und der STE mit seiner erweiterten Farbpalette wurde nie ausgenutz zumal das sowieso schwierig war da er auch nur genau so viele Farben gleichzeitig
darstellen konnte, wie sein greiser Vorfahre, nM-^Dhmlich 16. Dann kam der TT,
vollausgestattet mit neuen Graphik fM-^Dhigkeiten; voller stolz prM-^Dsentierte man den TurboAtari und bescherte der Atari Welt die wohl am wenigsten gebrauchte AuflM-^Tsung in der ganzen Atari Computer
Geschichte.....TTlow. Bis zum heutigen Zeitpunkt (9.10.1992) habe ich mehr Finger als es Programme gibt die diese AuflM-^Tsung nutzten,
auM-^^erdem war sie schon irgendwie eigenartig (vielleicht wollten sie einen Cinemascope effekt?), aber man kann immerhin in der AuflM-^Tsung
bis zu 256 Farben gleichzeitig darstellen. Da hat man jetzt einen schnellen Rechner der nicht nur die notwendige Farben (320X480 mit 256 Farben) aufbringen kann sondern auch eine recht angenehme und akzeptable AuflM-^Tsung hat(640X480 mit 16 Farben, Leider sind die nicht kombiniert, typisch Atari, sparen wie immer am falschen ende!),
und noch immer kein anstM-^Dndiges 3D Raytracer, Rendering program oder
Animator weit und breit bis vor kurzem: "Inshape" heiM-^^t das neue Deutsche Wunderkind im bereich 3D-Key-Frame-Animation. Alle Deutsche Magazine reden darM-^Aber und behaupten es sei "Konkurrenzlos". Was aber fast keiner weiM-^^ ist das es ein solches Program schon seit April 1991 existierte.
Die Produktreihe die ich meine ist die in der U.S.A bekannte "Phase-4" Kollektion von der Firma LEXICOR. Mit ihr kann man 3D-Key-frame Animationen machen, Raytracen und Rendern, und wann der Film fertig ist abspielen, auf Video aufnehmen etc. AuM-^^erdem unterstM-^Atzt sie jede ST/TT auflM-^Tsung und macht sogar von der

erweiterten Farbpalette des STE gebrauch. ZusM-^Dtzlich funktioniert sie auch mit der JRI & ISAC Colourboard, Leonardo und die Matrix Karten C32 & COCO. Ein Teil funktioniert sogar jetzt schon mit dem FALCON030 und unterstM-^Atzt die erweiterte Farbpalette und AuflM-^Tsungen. Diese Produktreihe hat man den EuropM-^Dischen Atari Usern vorenthalten, hauptsM-^Dchlich weil es komplikationen mit dem ehemaligen Vertrieb gab.
ZUR SOFTWARE (war aber auch Zeit!)
"Phase-4" besteht zur Zeit aus 4 Hauptteile bzw. Programme und aus weiteren kleineren
Programme die das leben des 3D-Animators erleichtern. Ich werde zuerst eine kurze Program beschreibung machen von jedem Bestandteil zur einfM-^Ahrung.
CYBERSCULPT und RENDER FOR SCULPT
Das sind die Modeller, damit werden die 3D Shapes erzeugt die sie dann als Objekte in ihrer eigenen Animation einbinden kM-^Tnnen.
CHRONOS-3D
ist ein 3D-Key-frame-Animator. Er verwendet die erzeugten 3D Shapes um damit eine ganze Filmsequenz zu produzieren. Durch ein sehr gut durchdachtes User-Interface kann mit ganz einfacher Point&Click manier die komplexesten Animationen erzeugen. Wer CHRONOS kauft kriegt Cybersculpt gratis dazu.
PRISM PAINT
Ein Mal und Animations program. Damit kann man Einzelbilder sowie erzeugte Animation von CHRONOS reinladen zum editieren, retouschieren etc.
Interessant ist sicher das dieses Program auch auf dem FALCON030 lM-^Duft und die erweiterte Farb-Palette nutzt. PRISM PAINT selbst war nur als Retouschier program gedacht und ist daher nicht so gut geeignet fM-^Ar selbst erzeugte 2D Animationen wie etwa Antic's Cyberpaint. Es ist mM-^Tglich aber relativ schwierig ohne CHRONOS, es ist aber zur zeit noch immer einzigartig fM-^Ar den TT.
PRISM RENDER
kann 3D animationen von Chronos laden und die ganze Animation in Fotorealistischer qualitM-^Dt produzieren bis zu 24 bit farbtiefe. Berechnung durch diesen Program kann Stunden und Tage dauern pro bild, das ergebniM-^^ ist aber imponierend. In Prism Render kann man dann auch jedes einzelne Objekt neu definieren mit anderen OberflM-^Dchen wie zb. WM-^Dssrig oder Durchsichtig etc.
ROSETTA-3D TRANSLATOR
3D File M-^Abersetzter, damit kann man IBM, MAC und AMIGA (IGITT!) formate
M-^Abersetzten (z.b. PIXAR) im RENDER FOR SCULPT format (3D4).
PHOENIX 512 (Noch kein Handbuch)
Texture mapping program, damit kann ich meine 3D shapes einzeln mit einer anderen Material Schicht "belegen" zb. Marmor, HM-^Tlzern etc. zwar kann das PRISM RENDER auch nur kann ich diese 3D modelle gleich in CHRONOS verwenden was dann natM-^Arlich viel schneller bearbeitet wird weil es gerendert wird aber nicht geraytract.

GENESIS
Effect erzeuger und Fraktaler Welten bauer.
UTILITIES
Extra Produkte die das Leben des 3D Animators leichter machen.
Geliefert wird "PHASE-4" in einem Gesamt Paket das aus CHRONOS-
3D, CYBERSCULPT, PRISM PAINT und PRISM RENDER besteht. Man
kann
aber natM-^Arlich alles selber einzeln erwerben. Da man zb. mit
CHRONOS-3D schon alleine anschpruchsvolle 3D Animationen
produzieren oder mit PRISM PAINT 2D bzw. nur Bilder malen kann.
Das Handbuch zu CHRONOS-3D, PRISM PAINT und CYBERSCULPT
ist sehr umfangreich. Sie sind in drei verschiedene HandbM-^Acher
abgepackt, je in einem DIN-A5-Ringbuch-Ordner. FM-^Ar CHRONOS gibt
es 4 disketten, fM-^Ar PRISM PAINT eine und fM-^Ar CYBERSCULPT
ebenfalls eine. Das Handbuch gibt es zur Zeit nur auf English,
aber es ist sehr gut und einfach geschrieben so das selbst
AnfM-^Dnger der Englishen Sprache damit zurecht kommen kM-^Tnnen.
Es ist nicht
schwierig eine anschpruchsvolle Animation zu erzeugen. Um ihnen
als Leser einen Eindruck zu verschaffen werde ich ihnen wM-^Trtlich
beschreiben wie man einen 3D Film mit diesem Produkt erstellen
kann und werde ihnen dabei gleichzeitig (hoffentlich) das Produkt
nM-^Dherbringen.
ERSTELLEN DER OBJEKTE
Um einen 3D Animierten Film zu produzieren mM-^Assen wir zuerM-^^t die
Akteure dazu produzieren. Das kann jetzt irgendein Haus, Skelett,
Ball, Kreatur sein. Um so etwas zu produzieren verwendet man
entweder Cybersculpt oder Render for Sculpt. Cybersculpt ist
trotz des Alters noch immer eines der besten CAD 3D Modeller fM-^Ar
den Preis. Cybersculpt bietet als basis 8 verschiedene 3D
KM-^Trper vor, ist aber nicht darauf beschrM-^Dnkt. Man kann auch
eigene neuartige formen mit den 3D Editor machen, nachdem man
seine Grundform gemacht hat kann man dann noch immer dazu weitere
3D formen geben, man kann das original verschieben, verdrehen,
vergrM-^TM-^^ern usw. und auM-^^erdem erlaubt Cybersculpt auch einige
effekte die dann als 3D Bild besonders interessant ausschauen
zb. magnet verschiebt alle punkte in die richtung des magnetes so
kann man den Eindruck einer delle in dem 3D Model geben.
Wegen des Templates kann man sehr genau die einzelnen
verbindungspunkte einsetzten um eine ziemlich genaue 3D Form zu
produzieren. Trotz all den funktionen ist es mM-^Ahsame arbeit und es
kann manchmal stunden dauern bis das gewM-^Anschte Model fertig ist.
Sollte man zu faul sein dann kann man 3D files umsetzten von den
traditionelleren CAD 3D Graphical Home-PC-Hardware. Wie zum
beispiel Apple (zb. Macrenderman files), Amiga Sculpt (Ughh! Wer
will das schon!?) oder IBM DXf10. Diese files kM-^Tnnen dann mit
hilfe des ROSETTA 3D File translator auf CAD 3D2 format
konvertiert werden so das man diese 3D Modelle im ATARI mit
CHRONOS verwenden kann.
Nachdem man jetzt seine Objekte hat kann man diese dann in

CHRONOS-3D einsetzten und animieren.
3D KEY-FRAME-ANIMATION
Die "Key-Frame-Technik" nimmt viel mM-^Ahsame arbeit weg.
CHRONOS-3D
arbeitet mit sogenannten "Tween-frames" und "Key-frames" indem
der Computer die animierten AblM-^Dufe selber produziert zb. habe
ich 90 frames zur verfM-^Agung und ich mM-^Tchte ein 3D Model zwischen
den frames 1 und 90 auf 360 grad verdrehen. Alles was ich machen
muM-^^ ist das model auf frame 1 auf 0 grad lassen und dann gleich
auf frame 90 gehen und das model auf 360 grad verdrehen (Das
sind die Key-frames). Dann berechnet der Computer die ablM-^Dufe
zwischen den frames schon selber(und das sind die Tween frames).
BEDIENUNGSFREUNDLICH UND EINFACH
Chronos-3D M-^Aberrascht durch eine sehr einfache
BedienungsoberflM-^Dche. Man kann im wahrsten sinne des wortes durch
einfaches point & klicking schon recht gute animationen
erstellen. Es gibt in den Setup optionen womit ich in Chronos
wM-^Dhlen kann ob ich mit Wireframes oder Shaded Objekte arbeiten
will. NatM-^Arlicherweise ist das arbeiten mit Wireframes viel
schneller, nur um die eigentliche Animation zu produzieren.
Chronos hat ein kleines extra, man kann alles in box wireframes
umwandeln, so ist das bearbeiten viel schneller.
Die Animation Tools (Werkzeuge) sind sehr M-^Abersichtlich
eingebaut. So kann ich zb. durch einfaches anwM-^Dhlen der funktionen
meine 3D Objekte, verformen, vergrM-^TM-^^ern und verkleinern in allen
mM-^Tglichen richtungen (entweder nur breite, oder lM-^Dnge verM-^Dndern
usw.), verzerren oder rotieren M-^Aber die X, Y, Z und XY achsen.
Weiters kann ich auch auswM-^Dhlen ob ich es M-^Aber den Zentrum des
Objektes
oder M-^Aber den einstellbaren Ursprung rotieren lasse. AuM-^^erdem
kann man mit dem "Cycle" command Animationszyclen zu produzieren,
so das ein Object sich in ein anderes verwandelt. Mit dem Add
Morph kann man dann die Zwischenphasen (Tween-Frames) dazugeben
so das der Computer die verwandlung von Objekt A zu Objekt B
umsetzt, voraussetzung ist das sie die gleiche Punkteanzahl
haben.
Das Objekt muM-^^ man dann irgendwie Belichten sonst kriegt man nur
eine
Farbe auf dem Bildschirm....nM-^Dhmlich Schwarz.
BELEUCHTUNG
Es gibt 5 verschiedene Lichtquellen. Das erM-^^te wM-^Dre die "Point
light source" und simuliert eine Kerze. Das zweite ist ein "Solar
source" das eine entfernte lichtquelle simuliert, etwa wie die
Sonne. Dann gibt es noch ein "Ambient light" das einen Lampenlicht
produziert, einen "Spot light" das genau gezielte Lichtstrahlen
produziert und "Global lighting", die Globale belichtung. Alle
licht typen sind einstellbar auf LichtintensitM-^Dt und Strahlen
verbreitung und im falle eines Spot lights kann man auch den
"Inside Cone Angle" und "Dropoff Angle" verM-^Dndern. Man kann so
viele Lichtquellen erzeugen bis der Speicher platzt, jede neue

Lichtquelle wird als Objekt behandelt (auM-^^er Global) so das man
auch diese Objekte bewegen und animieren kann zb. bewegende
Spotlights oder eine fallende Lampe.
Mit einer funktion namens "Track", was in diesem fall so viel
heiM-^^t wie verfolgen, kann man Objekte auf andere selektierte
Objekte ausrichten. So ist es ein leichtes ein mitschwenkendes
Scheinwerferlicht zu erzeugen das zb. ein gehender roboter
verfolgt.
BLICHRICHTUNG
Man kann den verlauf der Animation von der sicht des Regisseurs
oder von der Kamera aus besichtigen. Durch ein Klick auf den
entsprechenden Icon wechselt man zu Regisseur oder Kamera.
Wenn man auf den View Icon draufklickt kriegt man eine neues Menu
das den User erlaubt den verlauf der Animation durch die Kamera
(oder Regiesessel) zu beeinflussen. Auch die Kamera wird als
Objekt behandelt und so kann man sie auch bewegen bzw. rotieren,
drehen und aus jeder mM-^Tglichen perspektive beobachten. Man kann
so die Animation in jeder mM-^Tglichen perpektive beobachten.
Chronos erlaubt bis zu 8 Kameras zugleich, jede ist einzeln einstellbar.
RENDERING & AUFNAHME EINES FILMS
Man hat eine auswahl zwischen Phong, Goraud und Flat shadings
wM-^Dhlen die man dann in entweder fixed oder random dithering
rendered.
Mit Random dithering wird jedes frame neu angepaM-^^t, so das
animierende Objekte mehr realistischer und lebendiger erscheinen.
Man kann jedes einzelne Objekt definieren. Nachdem man
das gemacht hat kommt man in den Recording Editor wo man die
fertige Animation dann einzeln berechnet und das wird dann im
hauseigenen FLM (oder DLT) Format abgespeichert. Auch der Recording
Editor
hat eine enorme Funktionsvielfalt. So kann man nicht nur in
sM-^Dmtlichen ST/TT auflM-^Tsungen aufnehmen, sondern hat auch die wahl
zwischen MATRIX, und ISAC Graphikkarten. Leider ist eine
Anpassung an die PopulM-^Dre Crazy Dots noch nicht mM-^Tglich weil
diese Karte nocht nicht in Amerika auf dem Markt ist. ZusM-^Dtzliche
effekte wM-^Dhrend der Aufnahme sind auch mM-^Tglich wie zb.
Schattenerzeugung (Dauert sehr lange), Antialiasing und Point
Cloud. Die Bildberechnung geht auM-^^erdem relativ schnell vor sich
hin, natM-^Arlich kommt es auf die KomplexitM-^Dt der Animation an wie
lange es dauert, aber zb. 5 Kugeln auf Phong Shading,
Antialiasing und Random dithering in der TT 320*480*256 Farben
AuflM-^Tsung
dauert etwa pro bild weniger als 4 Minuten ohne TTRAM mit NVDI
2.00
Jedoch kann man auch echte "geraytracte" Animationen erzeugen,
die dauern dann aber um einiges lM-^Dnger, und werden durch den
zusatz program PRISM RENDER gemacht. Sobald die Animation fertig
ist, kann die Bildberechnung (Recording) beginnen, von dort aus hat
nur noch mehr der Computer das Schuften.
Wenn man nun mit seiner Animation fertig ist hat man die wahl.

Entweder wird es, wie vorher beschrieben, in CHRONOS gerendert, was relativ schnelle Ergebnisse erzeugt oder es kann in Photorealistischer qualitM-^Dt mit 24 bit Farbtiefe geraytract werden. Will man nun ein Bild oder Animation im echten Raytracing verfahren produzieren nimmt man PRISM RENDER.

PRISM RENDER

kann wie beschrieben in 24 bit Farbtiefe bilder ausrechnen. Ein Bild das mit PRIM RENDER berechnet wird kriegt ein fast Photorealistisches Bild weil es das Raytracing-verfahren verwendet. So kann man in RENDER neue material effekte dazu geben zb. kann ich mein 3D Haus mit Glass beschichten oder denn boden mit Marmor belegen und den Dach aus Gold, die TM-^Arglocke aus Diamanten, den Gartentisch mit Edelsteine belegen....nur leider ist es nicht echt, aber wenigstens kann man vor dem Bildschirm trM-^Dumen.

NACHBEARBEITUNG UND RETOUSCHIERUNG

Die fertige Animation kann man dann noch ganz schnell verschM-^Tnern oder kleine Copyright Notize dazugeben damit keiner ja vergiM-^^t wer dieses Meisterwerk geschaffen hat. So etwas wird mit PRISM PAINT gemacht. PRISM PAINT ladet die fertige Animation hinein und man kann im nachhinein die Bilder schneiden, retouschieren usw. PRISM PAINT ist als Animations Editor von CHRONOS (oder RENDER) erzeugten Bilder gedacht. Obwohl PRISM PAINT, genauso wie CHRONOS, als eigenes Produkt sehr gut ist (und auM-^^erdem gibt es noch kein anderes Mal und Animations program fM-^Ar TT), kann es nicht CYBERPAINT fM-^Ar den TT sein.

Die Funktionen die dieses Prorgam hat dienen besser zur Retouschierung und Editierung als die erzeugung von 2D Animationen mit der Maus (oder Graphik Tablett). Antic's CYBER-Series war mehr fM-^Ar 2D Animationen gedacht mit 3D fM-^Dhigkeiten. Lexicor's PHASE-4 ist das Gegenteil mit Schwerpunkt 3D Animation.

Wer dann noch gerne ein Sternenbild erzeugen will kann mit GENESIS bewegende 3D oder 2D Sternenbilder produzieren a la Enterprise und sie in der eigenen Animation einbinden.

ABSPIELEN DER FILME

Nach tagelangen Schuften hat man nun sein Meisterwerk geschaffen. NatM-^Arlich will man sein fertiges Produkt abspielen, oder vielleicht auf Video aufnehmen. DafM-^Ar gibt es ein Player das die fertige bearbeitete animation abspielt auf bis zu 60 Bilder pro Sekunde (24 ist mindestanzahl fM-^Ar Echtzeit). Dem Player gibt es als eigenes Program das als Freeware behandelt wird so das man fertige Animationen zb. in PD verM-^Tffentlichen kM-^Tnnten und ist eingebaut in CHRONOS, PRISM PAINT und PRISM RENDER. Das tolle M-^Aber diesen Player ist das er auch von der Disk aus die Animation abspielen kann. So braucht man keinen Massenspeicher mehr um seine riesige Animationen zu besichtigen. Mit einer Harddrive die 15 m/s schnell ist kann man schon bis zu 48 Bilder pro Sekunde abspielen, was eigentlich mehr als notwendig ist.

ANWENDUNG

Die Hauptzielgruppe sind wahrscheinlich Graphiker, Architekten, Zeichentrick
Animatoren, Designer und Werbefilmer. Aber auch der Hobby User kM-^Tnnte dieses Produkt interessieren denn man braucht keine gut Graphik kentnisse zu haben um beindruckende filme zu machen. Wer sich einen Eindruck verschaffen will wie seine kM-^Anftige Wohnung aussehen soll ist auch mit "PHASE-4" gut bedient, aber dazu braucht er dann nur CHRONOS, auM-^^er er will es in Photorealistischer qualitM-^Dt.

FAZIT

Man will wahrscheinlich behaupten das ein solches Program nur fM-^Ar Profianwender ist. Zugegeben, es ist meiner meinung nach sehr Professionell gemacht worden. Die Programmierer von CHRONOS-3D schreiben jetzt auch SGI Software, wahrscheinlich der Hauptgrund warum dieses Produkt einen so ausgereiften Eindruck macht. Aber gerade deshalb ist dieses Program fM-^Ar jeden maM-^^geschneidert. Der Key-frame-Animator ist sehr Bedienungfreundlich, fast jede funktion wird noch mit einer HELP! taste belegt das mit kurzen SM-^Dtzen eine erklM-^Drung abgibt. ZusM-^Dtzlich gibt es ein Stichwortverzeichnis in dem ebenfalls Hilfetexte abrufbar sind auM-^^erdem sind sM-^Dmtliche MenupM-^Ankte sind
M-^Aber sogenannte "short-cuts" oder auch Tastaturkommandos abrufbar.

Die Herstellung eines Filmes war auf dem ST oder TT nie so einfach gewesen. Das heiM-^^t nicht das ich in 5 minuten eine super-animation habe aber das arbeiten und produzieren einer Animation geschieht sehr schnell im verhM-^DltniM-^^ zu existierenden Atari Programme. NatM-^Arlich muM-^^ man lange berechnungszeiten in Kauf nehmen aber der TT (und schon gar nicht der ST) ist nun mal keine Graphiks Workstation, mit "PHASE-4", und ganz besonders CHRONOS, hat der Atari-User ein Produkt das auf eine gleiche LeistungsfM-^Dhigkeit aufwarten kann wie manche Macintosh Animations Software. Zwar ist ein Super-Mac viel schneller, aber auch viel kostspieliger, und die Software ist auM-^^erdem mindeM-^^ten 3 mal so teuer wie "PHASE-4".

Es gibt fM-^Ar den ATARI kein einziges Produkt das "PHASE-4" schlagen kM-^Tnnte. Die Reife des Programmes wird auch dadruch demonstriert das es
"PHASE-4" ist ein Produkt das im wahrsten sinne des wortes Konkurrenzlos ist im Atari Markt. FM-^Ar etwa AS 3000 kriegt man das gesamt Paket das aus CHRONOS-3D, PRISM PAINT, CYBERSCULPT und PRISM
RENDER zusammen mit sM-^Dmtlichen Utilities. Es ist auf jedenfall sein Geld wert.

6750. Info on Mint

Newsgroup: comp.sys.atari.st
Date: 1993-05-09 22:20:19 UTC
From: palm_erd@csusys.ctstateu.edu
Message-ID: <1993May9.172019.1@csusys.ctstateu.edu>
Source record: 206082

I am looking for info on installing the latest version of Mint (whatever that may be, I haven't ftp'd it yet). What will I need for a system, and what will I need in the area of a compiler.
Thanks.

6752. WANTED: PD game 'SQUIXX' (?)

Newsgroup: comp.sys.atari.st
Date: 1993-05-10 02:26:09 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1993May9.222609.1@sscl.uwo.ca>
Source record: 206089

My wife has been bugging me for 3 days now...so does anyone have the PD game SQUIXX, or know where to FTP it from? PLEASE...my marriage could depend on it...well, maybe not, but she would like to get a hold of the game. We have a PC version on the lab computer and I have to haul her of it when we leave :^) Any help would be MOST welcome!

From: richardson@sscl.uwo.ca
Message-ID: <1993May9.223045.1@sscl.uwo.ca>
Source record: 206090

Has anyone gotten Redacteur 3 to load Word Perfect files? The reason I shelled out for this word processor is so I can easily work on my thesis at home...and maybe get it done on time!!! The problem is that Redacteur doesnt seem to want to load a WP file in! I just get garbage! It also claims to load Word Writer ST files (my old word processor)...again a no-go! While the features of this package are amazing, the MAIN reason I got it was the compatibility with other formats...so any help in achieving this would be muchly appreciated :^)

>using Uniterm (set at 19200 baud, since this is the fastest the modems on the
>other end can go), Serial Fix 2.0, and was connected v42bis (data compression
>and error checking on). This type of file should have made good use of
>the data compression stuff, so I was expecting to get closer to 2000 cps
>(if not beyond). My questions are as follows:

I had good experience with TurboCTS, it not only fixes the handshaking
problem, but it is a better serial driver too. I was using ICDAdspeed on a
Mega4ST TOS1.4 though.

>
>1. Was this a reasonable expectation? Am I really losing performance?

Not too reasonable, and yes you are loosing performance. The main
reason would be the modems limited buffering. When it uncompresses the
incoming data, it has to get rid of it fast when there is no more
internal buffer space, or it will have to slowdown the incoming data.
That is why you need a connection speed equaling to the maximum possible
data tranfer. Since there is a delay involved in starting and stopping
the flow, you are basically reducing the raw transmit capacity that is
being used. Also, the ST series are barely able to cope with such data
at 9600 abuds when running at 8 Mhz, and that is with very good drivers.

>
>2. Is there any advantage to using hs_fix.prg instead of Serial Fix 2.0?
> I think there is something in the documentation about making serial buffers
> bigger. Is this where I am losing my performance?

TurboCTS is my favorite.

>
>3. How does the cps rating work exactly? I am currently interpreting it to
> mean "8-bit characters per second", so 9600 baud = 9600 bits per second
> = 1200 cps (max). Is this correct?

Nope, 1 byte tranferred from the modem uses anywhere from 10 to 11 bits.
Startbit, 8 Databits, 1 or 1.5 stopbits. Also, there is some delay
between the two frames as well.

>
>When I download binary files, I get 830-880 cps. The machine is a Mega2ST.
>Thanks in advance for any comments.

Also consider the machine you are connected to. I figure that most bbs'
are not connected to their modems with 38400 bauds. Some are just at
9600 bauds. In that case, you wouldn't be able to transfer more with a
Cray computer on your end.

Just a small caution: You must make sure that 8th bit is Normal,
(under compatibility dialogue) and make sure you are using VT102/ANSI
emulation (under emulation dialogue).

By doing this, I have personally seen Connect work properly on
an IBM ANSI-BBS configured BBS. Heck, it even worked with Warp9 3.7 going
(as long as I didn't use Warp9's font substitution ;>).

> Wolfgang

BTW, for the person who was having problems with the Medium Res.
screen - have you tried the other fonts mentioned, such as the Rufus
font (or was that a Gemini font)? If anyone would mind posting the names
of any fonts that allow 80x24 in Med. res (without scrollbars of course)
I'm sure we would all appreciate it (if only to put out the flamefest, or
at least curb it a bit).

6761. WinRec 1.3 hard disk recorder for the ATARI Falcon uploaded

Newsgroup: comp.sys.atari.st
Date: 1993-05-10 08:23:08 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <1sl3dcEqri@uni-erlangen.de>
Source record: 206096

WinRec V1.3 for the ATARI Falcon

The version 1.3 of the WinRec harddisk recording program for the Falcon030
is now available at archive.umich.edu in the atari/falcon directory and
at ftp.uni-erlangen.de.

WinRec is the first SW harddisk recording program for the Falcon. Without
any additional hardware, you can record 16Bit stereo sound at sampling rates
up to 50kHz directly to hard disk. So the length of the samples is only
determined by the free hard disk space.

It is also the first shareware program to use the DSP for online sound effects
during recording or playing. Many DSP-LOD files are included in the archive.

WinRec is also good for the use with Fortune V1.0, which is available
at the same place.

I did that long ago, and it's a snap.

> But it's a hard thing to add a second drive to your Megafile.

Not at all!

> Your main Problem will be getting an used MFM-Drive, you will
> find no new Drive, because they are no longer produced. And years
> ago, when the PC-People used MFM-Drives, they didn't have the
> big capacity they have now. Be careful *not* to buy a RLL2.7 Drive!

Why not? RLL drives are just drives with a higher potential
flux change rate and high-speed signal channels. Most, if not all
of them should work just fine in MFM mode.

The main problem with adding a second drive is the Megafile's
power supply and the fact that you need drivers that look for a
second drive in the Megafile. (AHDI won't do that!)

Hi there!

A friend of mine wants to compile his diploma paper in musical science
with the help of a computer, i.e. he needs a software package to integrate
notes into text. Does anybody out there do something like that or can hint
me what sotware would serve this purpose?

What do you know about MUSITeX, or a notes-editor that is able to produce
postscript-output?

Please mail me directly.

Thanks in advance,
Ralf

ST Review report that Atari UK said "new style cases won't be available before June at the earliest. Atari Germany meanwhile made no mention of the new case at Cebit or Frankfurt.

Anyone?

David.

Excellent. i think i even understood it ;-) Now the only benefit that i can see over the s/w patch is that a second drive would not be reduced to a 6ms seekrate. i don't want a 2nd drive, and i'd probably use a HD one if i did, but your solution is very elegant. Now all i have to do is to actually do it !

>The best method is to make the MMV adjustable, and adjust it so that the

Bjarne!

No, it's not by the R&D Institute! [We haven't got one!] It's by Take Control who are at the Research Park on our campus.

Sorry no details on what the program's like... I think it's M-ROS compatible though...

Hi folks,

For the first: NOONE has a contract of "exclusive rights for distribution"!
"exclusive rights for distribution" meens: If there is any person/firm
which should have it, no other can selling the programm (in this part of
the world)! !!!!!BUT ALL EXISTING VERSIONS CANNOT SALE (it's Shareware)!!!!!

Second: GEM-View is SHAREWARE up to version 2.24 and anyone can get it
from GEnie without pay for it. (A commercial version don't exist in this
moment!) The SHAREWARE-Version can be copy free and MUST be registered,
if it is used, by myself and the shareware-fee must paid to me. To make
it easier for users in USA/Canada, Cybercube can answer user-questions/
user-requests and make a list for all the persons, who are interest in
registration. I will get the list and the money; the registration will
be made by myself. This is a user-support not a "rights for distribution",
i think! Lexicor has not this right of user-support!

If there is any, who asserts, that no shareware fee must be paid for the
existing versions of GEM-View (less or equal 2.24), is wrong!
If you use GEM-View, you must pay the shareware fee (DM 30,-- or US$20,--)
to me, the registration will ONLY made by myself!

!!!!!!!!!!!!!!!!!! ALL OTHER ANNONCEMENT ARE WRONG !!!!!!!!!!!!!!!!!!

NO DISCUSSION ABOUT RIGHTS OF DISTRIBUTION FOR GEM-View IN "comp.sys.atari.st".

This is a warning to Lexicor and Cybercube!

Curt.Fluegel@f47.n282.z1.tdkt.kksys.com (Curt Fluegel) writes:
* You cannot play .MID files through the internal sound chip. You would have to
*hook some sort of sound module to the Atari midi ports.

This is not true. I have a cheesy little sequencer/editor
program which uses the sound chip as an extra midi channel.
A .MID file has midi data in it. That doesn't mean you are
restricted to stuffing it out the midi port. The ST is an
amazing computer. It can actually do something with the
data in a midi file. It can look at the data, see what note
is to be played, and do a real simple table-lookup conversion
to find what command to give to the sound chip.
The ST can actually BE a midi synthesizer. A damn pitiful
one, to be sure, (3 voice polyphonic, a RATHER limited range
of sounds), but a midi sound module, nevertheless. You'll
find that several sequencer programs which use the midi port
also supplement that with the sound chip, playing midi data
on either the midi port or the chip, interchangably.

K-Minstrel by Kuma does allow for some very basic midi-file playing.
K-Minstrel is no longer supported by Kuma, but Kuma software (not
books) have been sold to Hisoft. However I don't know if Hisoft will
continue all products (I doubt it).

Source record: 206162

Greetings,

I've just installed MultiTos on my MSTE (Yes I Know Tut Tut, but I wanted to tryit before trying to buy it! 8-)).
It looks very nice, runs a little slower than T206 but thats to be expected.
Now I've just two little gripes about it. And if anyone happend to know the solution, then all the better.

1. The new "show" reader, the window one, like switching the mouse off!
The mouse still pull the menus down etc, but is not drawn on the screen.

2. When there is an error, its just writen to the screen, right over the
top of what is already there. Even if you are "show"ing stderr from
U:\dev\. Its just the same thing the sun sparc stations do. And it
really annonys people.

Other than that, Mtos is great, althought the MiNT program Limit (which you needto use on programs like 1STword which nics off with all the memory) doesn't clear the command line of it's options! 8-|

I've just tried the emperor level, it's pretty hard. I prefer that.

I noticed something else, that really surprised me: during the last play, the world was exactly the same as in a previous play, even the location of special resources and the starting point of civilisations. And I just chose 'Start a new world', not 'Earth' ! Is the number of worlds limited ? I thought it was randomly generated...
It's strange that it crashes in the world conquest sequence. I changed the name of the file SLAM.LBM and it works on my ST, although the screen is corrupted. Do the concerned persons play on hard drive or on disks ?
For myself, I play on disks. Could be an explaination...
Could somebody warn us if he gets a fixed version ?

>article will bring? <other comments deleted>
>
>I'm not questioning piracy legalities just how is this article supose to
>help anything.....

Keith, IMHO, the main purpose of Dorothy Brumleve's article on the state of pirate BBS systems was one of information... to advise the public of just how widespread the problem is. Many seem to have the idea that since the Atari market is so depleted that piracy is no longer a problem. On the contrary, as the buying market shrinks, piracy becomes a larger problem. Her article informs the readership of how such pirate boards operate, how they have such a negative effect on all Atari users, and gives a little insight into the "psyche" of a pirate via quotes from various pirate boards.

A secondary purpose is to put the operators and participants of such boards on notice. The IAAD (Independent Association of Atari Developers) has gained access to a number of pirate bulletin board systems and is accessing these boards to identify what members' software is available for illegal download. Several letters have gone out to pirate BBS operators and pirate BBS members (once their real name and address have been identified) giving them warning that the IAAD is aware of their activities.

A third purpose is the closure of such pirate BBS via the operator's own decision or via criminal prosecution and confescation of equipment.

Believe me... developers have known about the extent of the problem for a long time; it's no surprise to us. And if average Joe wishes to call one of the listed pirate BBS's that the IAAD is monitoring, they are certainly free to do so.

The article is very well written, IMHO, and should be a real eye opener for many folks. If it is possible to eventually repost it here, I would urge everyone (pirate and legit user alike) to read it.

Just a quick info note: Check out a new word processor called
MARCEL. It's native file format is RTF, and I have succesfully
taken a file from it and used it at work in PageMaker 4.0.

Also, it will load many file formats, including WordPerfect (but,
I think, only save as a few). MARCEL also will load anything in
as a text file, providing you choose the option to do so, and would
therefore allow much more to be read with only a need to edit
out funky control characters and reformat text attributes. The
WordPerfect files I tested, however, entered all text attributes
(i.e. bold, italic, underline, etc.) fine.

MARCEl is being advertised in recent issues of ST Informer and
Current Notes. And, I am not affiliated with Marcel other than being
a user impressed from playing with the program for a week before
lightning zapped my trusty ST (hope it can be fixed! :^)).

Has anyone actually seen a Falcon in a high st. shop in the UK yet? I have been to both Dixons and Tandy, to see if I could get a look at one. Both had never even heard of them, Tandy even tried to sell me a PC - I quickly declined.

So much for Atari's promise that they'd be here by March '93

hmm.. could work, but i'm not sure about this. running oberon (which is
a programming language AND an os) on an emulator 8-) but why not try it?
please let us know, if anybody tested this.
if it would work, there was still the problem with the mouse: oberon
uses a 3-button-mouse, the mac 1 button, the st 2 buttons. what a chaos ;)

6790. Small 2.5" drives!

Newsgroup: comp.sys.atari.st
Date: 1993-05-10 16:10:27 UTC
From: x91mikowski@gw.wmich.edu
Message-ID: <1993May10.111027.9743@gw.wmich.edu>
Source record: 206171

Just thought I'd send along a little tidbit of info for you Falcon users or "soon-to-be" users. Several drive manufacturers have introduced 2.5" drives in excess of 100meg. Toshiba has a 2.5" drive in excess of 200 meg! I still don't know if these are IDE or SCSI though. Now, wouldn't that be hot in a Falcon?!?! I'll repost when I get more info.

Later,
Bernard Mikowski

Just a followup on those 2.5" drives:

Areal Technology (408) 436-6800
Model a260
2.5" Platter
15mm height
glass platter(s)
260 Meg
$525

Toshiba
Model mk2224fc
2.5" Platter
19mm height
glass platter(s)
213 Meg
$725

Still don't know if they are IDE or SCSI compatible.

Later,
Bernard Mikowski

Or, try the Maxtor.
They have 25128A and 25256A for the 128meg and 256 meg and they are IDE. (The SCSI version is 25128S and 25256S which is not very easy to get.) These are availible parts from some hard drive dealer. (I don't have a list.) These has been out for some time now, so should be relatively easier to find.

>] No, but the Amiga can format, read and write MS-DOS (and, of course, ST)
>
>Not without additional software though!

Hel-lo??? MS-DOS file reading/writing is *included* with the operating system!!! Do you know what you are talking about?

Anyway, this is all a moot subject. First of all, people (and supposed engineers, no less) are using a very generic term - "disk format" - and are using it in not quite its true meaning. What people have actually been talking about when discussing sectors per track, etc, is more like *DRIVE GEOMETRY* - there are a finite # of drive geometries, and are all hardware dependent. This is what is so baffling. The ST and Amiga use the same #$@#%#$ kind of disk drives, so how can there be any argument here??? Amiga and ST drives at the hardware level read and write exactly the same (MFM) and at the same speed! Okay, so that's settled.

Now, we have the other part of what is all under the generic term of "disk format" and that's the filesystem. Here the two are very different. Each has it's advantages and disadvantages.
Here's what bother's me though: The ST users are trying to defend the fact that they are locked into one filesystem, namely an MS-DOS type filesystem. Why has no one on either the ST or PC ever come out with a new filesystem that allows longer filenames and whatever other nice features you might desire? What is do difficult of writing a new filesystem that reads both the new disks and the old 11-character filename disks? (Beats me.)

Now, for those who love the safety and compatibility of your MS-DOS-type filesystem, there can be no argument against the Amiga since you can easily mount the MS-DOS filesystem on all your HD partitions, all your floppy drives, etc. and you can go on your merry way using MS-DOS filenames for all your files and programs. What seems to be the problem here? How can you criticize the fact that the Amiga allows BOTH filesystems to be mounted on any # of devices simultaneously and will recognize what disk is inserted automatically? If you hate the Amiga FS, just boot it and use the MS-DOS filesystem! No big deal....And you'll *Still* be able to read your friends' Amiga disks with no problems.

Now, I realize the concept of inserting a disk and having the machine automatically figure out what disk is inserted is a foreign concept to ST and PC users (Mac, NeXT, Amiga, and some workstation users are quite blessed with such technology) but that's not my problem, is it?

Case closed.

In article <1993May5.090321.6251@daimi.aau.dk> lynbech@daimi.aau.dk (Christian Lynbech) writes:
>It could also be mentioned that the distribution kit contains all necessary
>files for getting GCC up and running, even though you are not necessarily
>getting the absolute latest versions.

I was working on a document to fully describe how to compile MINT from the MDK. Unfortunately my heaviliy modified 1040ST with nearly every add on possible burned out. My hard drive also went out (actually I think the hard drive was the fault, becuase brand new the hard drive didn't work on a friends 1040ST and also burned out shortly after being connected to the drive). Anyways, I wonder if I should write a shell script for the MDK instead. That was the use simply installs the base configuration with the GCC and then runs a script. The problem that I saw was that newer versions of mint seem to need differentt files (some miss asm.y, which others use a prgflags.prg which the ST doesn't have, need, or use). I would be willing to try, but I am not going to have a working machine for a few more weeks.

When I begin work at IBM developement, I will have to sign a contract unconditionally giving then all of my intellectual property. I'm afraid that I will not be permitted to do any IBM un-authorized programming which leaves me unable to contribute to the Atari community. I think IBM is afraid that I'll give some piece of their PC operating systems AIX and maybe OS/2 away to MultiTOS.

Does anyone know how to copyright ideas for software before going to work for a large corporation. I don't want to make any money off of this software, I just want to learn and become known in the Atari community. Some of the things I have worked on designing (no code just data-flow diagrams and structure charts for the algorithms) are:

- NeXT Step like login for MiNT and MultiTOS (set's user id)
- Updated C language version of UniTERM
- A fully functional version of Korn Shell for the Atari
- TeX / LaTeX tools and TeX installation information for TOS and MutliTOS/MiNT

Other products I have already built for School projects are:

- A Multi-processor computer using M68332 (68020 like chips) and an operating system for it. Both a hard ware and software design

- An artificial intellegence scuba-diving partner to warn the diver about unsafe diving conditions BEFORE the diver encounters those problems. Also monitor's the diver's body conditions.

- An Ethernet network analyzer which gathers information on multiple Intel Based PC's equiped with Ethernet cards, several RS-232 serial connections to a central Unix Workstation, and an X-Windows interface to graphically show statistical information and to show raw ethernet data for packet tracing.

Is a statement like this to the UseNET a good enough copyright? I don't want to be unfair to IBM, but I would like to still work on these projects without having to worry about breaking the law. This is USA law.

: Whoa there! Time out! The ST is good at many things, but even the
: most faithful ST owner would not say the ST's sound is good.

It depends on what you compare it to. Three voice plus noise generator isn't too bad compared to a piezo buzzer or a single speaker directly connected to an output port (standard PC equipment) ... it's just like my old Spectra-Video, had the same sound chip in it.

I think ST sound is quite acceptable, for standard built-in equipment. Okay, Amigas can do it better, but then again, they are more or less games-only machines (don't flame me, I'm writing this on my Amiga 3000 which is running UNIX because I can't stand AmigaDOS [and because I bought it for that purpose]).

> intellectual property agreements

Generally aren't worth sh*t. When I was working at Jeppesen, a friend of mine who was the VAX/VMS systems programmer developed a disk compression/defrag utility. He did it at the direction of the company, on company time, and under the terms of a standard intellectual property agreement which all employees had to sign.

He's now fairly wealthy from selling this program as a product. The company tried to sue him, but were advised by their lawyers that they'd lose and there was really nothing they could have done to prevent it. Apparently, if you think it up, it belongs to you as well as the person you were working for, regardless of prior agreements. (You can, however, sign away your rights to patent something. Apparently this is because a patent is a tangible thing you can give away your rights to, unlike an idea.)

This is not a legal opinion. Your mileage may vary.

There are many programs that save music as img files (or someo ther type of
file. Make you examples this was then impost them into your favorite word
processor or DTP program, (Notator and Calamus for example)

6808. Gadgets by Small voice-number?

Newsgroup: comp.sys.atari.st
Date: 1993-05-10 23:00:29 UTC
From: m91der@tdb.uu.se
Message-ID: <1993May10.230029.24632@tdb.uu.se>
Source record: 206191

I'm looking for the number to Gadgets by Small. I've tried 303-791-6098 which I thought was their voice-number. Unfortunately that number no longer exists. Is there a new number? If not, has Gadgets closed down? :-(

If they're still in business, does anyone know if they produce any nice accelerator cards for the MSTE?

Daniel Eriksson (m91der@tdb.uu.se, den@hgs.se)

Gadgets is still alive. Dave is working hard on the new version of Spectre.

He doesn't have any accelerator cards that will fit in a MegaSTE, but Jim
Allen of Fast Technologies has his TinyTurbo which will fit.

>NVDI then Speedo is the order I have them in my AUTO folder; works for me...

This reminds me of a couple questions:

Is Warp9 compatible with SpeedoGDOS?

We know that SpeedoGDOS uses its speedo fonts, but does it use the old GDOS or ATM fonts? Type1 at least?

Does Warp9 work with MultiTOS, or does the speedloading interfere, let alone the new aes, etc.?

Does MultiTOS work out of the box on STs/STe/TTs?

6816. Re: Piracy (was Re: Customer Satisfaction!)

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1smrdpINN22k@golem.wcc.govt.nz>
Source record: 206198

I think that posting of the piracy article was a very stupid thing to do....

Piracy has probably doubled since on the ST - all the other pirates
will have seen the list and think, 'hey more contacts, let's get 'em!'

It is 100% impossible to eliminate piracy, and everyone knows it is
a problem (even the pirates themselves), so it really was a pointless
article - especially as some of the people in the article were only
put in there as they had user-ID's on the problem boards, with no
evidence to back it up!

6817. Re: Orphan TT's

>couldn't find one on my second or third call. They can't be that hard to
>find. Sheldon Winick in NC is still selling them and MegaSTEs.

Basically what I did was to talk to the local shop first. They were
completely out. So I looked through all the Atari User mags I had and called
up every add that even hinted at having hardware. Even Toad was completely
out. Some of the shops tried calling other shops, but of all of them, only
one shop had a TT (ATY in San Francisco).

Actually, the local shop has a TT as a show-room model, but they
didn't want to sell it to me....

It will happily take on your old bitmap fonts, but what do you mean by 'old ATM fonts'?? These are Postscript fonts ant as far as I've know they haven't been supported directly on the Atari on anything else than Pagestream and the CompoScript sw PS interpreter (maybe Ghostscript, I haven't gotten around to set that up properly yet). They have never been a part of the 'global' font handling. A couple of the German vector apps do a conversion to Calamus or Didot format. Chagall will have the ability to use them too, but I don't know if that will be directly or trough conversion. I've been asking around on comp.fonts for a Type1 -> Speedo converter, but noone knows. Typical of Atari to pick the wrong standard... probably the cheapest one for them, though. Personally I think they would be better off with Postscript or even TrueType. These exist in large quantities even in shareware/PD form and are supported by the market. Speedo is dead on the PC and hard to get here. Not an inferior format, though.

> Does MultiTOS work out of the box on STs/STe/TTs? >

It did here. Some of your apps might need a little adjustment though, depending on which platform you run it on.

RE: D.A. BRUMLEVE

Well i read your reply to my comments on her article (I will try to post it here buy wednesday) and as it is to the average user i think we have different ideas.

I personally know/ am friends with about 25 people with ST's. The average user i have found from them seems to be one who likes to get a free game or program when ever thy can. They can't go into a store with in an hours drive to get anything so any chance they want to use. These people range from professional musicians to out of work musicians to school teachers to high school students. They are all the same. They have bought some of their stuff (Usually a word processor, their music program and few others and a couple games) after that most have mainly copied stuff. That is what i see the average user as and i do not think it is your view of an average user.

This view of the average user is why i see her article as mainly harmful rather then helpful. The people at comp.sys.atari.st are not average users.

Keith
(Once again let me say i am not talking here about piracy pro/con but the helpfulness of her article)

Software theft is illegal, therefore exposing the illegal operators
MUST effect there operations.

Anyone considering connecting to a BBS mentioned in the Brumleve
article would have to have rocks in their heads - they might as well
make 50 root login attempts to fbi.gov.

Sure, authorities MAY ignore the Brumleve article findings... but for
how long? Software theft is too easy. That article helps to tighten
the screws.

I turned up to a friend's place once and he was paging through some
file from a VERY organised software theft group. The file listed
just about every piece of Atari s/w I'd heard of. I was shocked.
These criminal (in Europe somewhere I think) SOLD copies of the
software - Retail prices and stolen prices were listed in the file.

Calamus. PC. Hmmm, sounds to me like you want to put a Gemulator in your PC.
At the WAACE show last year I demoed Calamus SL running under Windows,
on Gemulator of course. It runs just fine. So consider that as an
interim measure until Calamus for Windows really comes out. For more
information check out the review in the April issue of Current Notes magazine.

>>What kinds of things does it work with? Things like Uniterm only, or tings
>>like ConNect only, or graphics applications only, or what?

MonSTEr is freeware. I uploaded it to Compuserve and GEnie originally. Where
else it's available, I'm not sure. It was bundled with Quick ST but is
not exclusively part of the Quick ST package.

Although the program was intended for use on the STE (which has hardware
scrolling) the program does work on any ST capable of supporting higher
screen resolutions. i.e. an ST with TOS 1.4 or higher. Sorry, TOS 1.0 does
not support anything beyong 640x400. On a regular ST the screen updates
are slightly jerky, this is due to software emulation of the hardware
scrolling.

MonSTE can be used with any ST software that supports large screen monitors.
Pagestream and Calamus are no problem. Most word processors too. Programs
that write directly to screen memory and are hard coded for a 640x400
screen WON'T work. This includes the Tempus text editor and Turbo ST. You
need to use Quick ST or Warp 9 (instead of Turbo ST) when using MonSTEr or
large screen monitors in general.

I'm just curious to know if anyone other there is actually using MonSTEr
and if so on what kind of hardware and in what screen resolution. I've never
tried it on a TT or Falcon so I don't even know if it runs on those machines.
I hacked up a version for use on the PC and with a bit of work it could be
made to run on the ST again to provide resolutions like 800x600 and 640x480.
If anyone's interested in being a guinea pig just send email and I can
email you a newer file to try.

- Darek

Message-ID: <ersmithC6uM6s.20v@netcom.com>
Source record: 205960

In article <1sna1t$11o@ni.umd.edu> humphrie@ni.umd.edu (James B. Humphries) writes:
>I hate to be the bearer of bad news _AND_ a starter of rumors but...
>
>According to my sources the newest BETA of MTOS is 030 only (no ST
>support). Can anyone confirm and/or elaborate?

Nope, absolutely not. In fact, it's been well over a year (more like
a year and a half) since beta test versions of MultiTOS required an 030.
This should tell you something about the accuracy and trustworthiness of
your sources. Note also that even if the rumor were accurate, it would be
meaningless: it doesn't matter what machines the beta version runs on, only
the production version (which authorized developers have had for several
months now) matters.

Bottom line: MultiTOS runs on any kind of ST with at least 1 megabyte of
memory. I wouldn't necessarily recommend running it on < 68030 or with
< 4 megabytes of memory.

Thanks all,

The one and only order I now have in AUTO-folder is:

NVDI
SPDGDOS
MACCEL3
MINT

What I had wrong was that the order of SpeedoGDOS and the
mouse accellerator were exchanged. With the order above
all is ok.

Thanks again.

That is definitely wrong.

YOU CAN BUY MTOS NOW!

It's is available at the big ATARI dealers (like Shift or Maxxon) here
in Germany for DM99.

It works on all ATARI Computers.

There are no different versions for the 68000 and 68030 - although I would
find this quite good.

6838. ImageLab 2.1 ready & posted!

Newsgroup: comp.sys.atari.st
Date: 1993-05-11 11:54:57 UTC
From: hansen@hathi.informatik.rwth-aachen.de
Message-ID: <1so46h$ddo@urmel.informatik.rwth-aachen.de>
Source record: 205969

Hello everybody!

About one year ago, I got the source code for ImageLab 2.0 from Rainer Fraedrich, and started to improve the program. Now it's eventually done!

ImageLab 2.1 is a program for digital image processing running on every resolution (hopefully!), but using only black & white pictures and displaying them only in monochrome. ImageLab uses pictures with 256 shades of grey, which can be converted from TIFF, IFF, IMG or GIF format.

If you are interested in image processing, you should upload this program. It's available via anonymous ftp from ftp.informatik.rwth-aachen.de

The program and documentation is in german language!

Hope you like it,

Oliver

Message-ID: <1so6q7$k7u@rw8.urc.tue.nl>
Source record: 205970

Some people asked for Epson 24 drivers and the like. The following list shows that an Epson LQ-570 driver is available so it really does exist.

Drivers included with the Dutch release of SpeedoGDOS:

Atari SLM Laserprinters
Atari SMM804
Canon Bubble JET 10e
Epson FX-80
Epson LQ-570
HP Paintjet
HP Deskjet 500
HP Laserjet
NEC P-series
Okimate20
STAR NB24-15
STAR NX1000

Note:
These are included NOW with the separately sold SpeedoGDOS package. This might or might not be applicable to versions that come with the current Falcon 030. Of course Compo can change the included drivers at any time so this informationm might no longer be accurate.

Erlend.

6841. Multi-player games using MIDI or RS-232?

Newsgroup: comp.sys.atari.st

From: nikhan@erix.ericsson.se
Message-ID: <1993May11.125837.24749@eua.ericsson.se>
Source record: 205972

Since I've recently acquired my second atari ST (a STE at last), I'm wondering if anyone can help me with a list of games, arcade, MUD, and/or strategy, which can be played by, at least, two players with at least two computers. Personally I'd prefer to connect the computers with MIDI-cables, (I've got a few of those), but I'm also interested in games using the RS-232 interfaces. Further more I wouldn't mind if the programs could be run on different machines, i.e. Apple or IBM. It is no disadvantage if the programs are PD or Shareware.

Oh dear, Dixon's and Tandy - no chance. I'm surprised they didn't refer
you to a pet shop. I was in London last weekend, and was going to have a look
round there, but I never got a chance. Certainly there's nowhere in
Liverpool were you can get one. I'm probably going to order mine from
Hisoft (assuming they still have some) next week, so if you'd like to
take a look at it then mail me in a week or so.

Message-ID: <ERLINGH.93May11151353@storlind.storlind.idt.unit.no>
Source record: 205973

Okei, after popular demand (oh well, atleast one), I've compiled
a version of emacs-18.59 for 68000 ataris.
You need MiNT (version >=0.95) to be able to use this port.

It is available in the New directory as
st-emacs.tar.z
It is a gzip'ed tar'ed archive containing binaries, docs and
an install document.

Cheers
Erling

No, the answer to those riddles is not in the game. The answer to the two riddles in that stage of the entrance to the riddlemaster's tower are related, though.

What flies through leafless trees is the answer to one riddle, and the thing that destroys it (think "melt") is the answer to the above.

Dorothy's Article on pirate BBSs, "Small Developers, Big Business", was included as part of Atari Explorer Online v2 #9, which many netters subscribe to on the net (BTW, to subscribe to this online journal, send your request to stzmagazine-request@virginia.edu).

If anyone wants a copy of the article itself, send me email and I'll be happy to forward it to you. It's worth the read. We really need Dorothy's permission before posting it here and it's fairly long, anyway.

>evidence to back it up!

Steve, as I mentioned in my post yesterday, the primary purpose of Brumleve's article was one of education. You might be surprised at just how many users consider it of virtually no concern because of Atari's small marketshare, when it fact it is that same small marketshare that makes it so severe.

Telephone numbers of the handful of pirate boards mentioned in the article were not disclosed. But don't be naive... the numbers of other pirate boards are generally readily accessible to those who frequent any pirate BBS.

Yes, we all know it is impossible to totally eliminate piracy. But should that fact prevent us from trying to educate others as to the damage it does? And as to evidence... "speak not of what ye know so little of." ;-) A number of pirate BBS sysops and users of these boards _have_ been identified and letters sent to them from the IAAD. Other action on some boards is pending.

Sorry, but I am at a loss why would any _legitimate_ user would consider the posting of this excellent article as "a very stupid thing to do."

> sytang@lamar.colostate.edu
Here are the specs on the drives (can Mr. Tang supply Maxtor info?):

Areal a260
(408) 436-6800
2.5" drive
15mm height
262 Meg Formatted
$525 List (Under $500 through mail order)
Availibility: Mid-July or August '93

Toshiba MK-2224FC
2.5" drive
19mm height
213 Meg
$725 List

I'll probably get a 4 meg Falcon and then install the Areal drive. What would that setup cost me then? $1300 + 500 or $1800? In any case it would be great for doing some d-2-d recording!

Later,
Bernard Mikowski

Yep...pretty nice if you can find a copy. I haven't had much luck but my brother has had it for quite a while. He claims the only thing he's seen that was better was Links386.

Bob

Well, I searched the article in question and the word "average" does not
appear even once. Your description of the average ST user may be close to
the mark, sad to say, but I still fail to see your point.

Again... I fail to see the logic in how an informative article on the current
state of Pirate BBSs could be considered harmful. Illumination (by those
who have actually READ Dorothy's article, please) is encouraged. :)

If Atari wanted to end piracy, they could have by making the Falcon030
with a cartridge port that could hold a lot of information.

Just imagine Word Perfect on cartridge. There could be a small box
under the monitor that allowed the user to press a button for the software
he or she wanted.

I remember a product similar to this for the 2600.

But I don't believe that "software costs so much because of piracy"...
Take a look at a Sega Genesis cartridge. They sell thousands and
thousands of these cartridges and for $59 to $79.

I wonder what would happen if these cartridges could be pirated.
Would Sega sell them for $129?

>

6854. Recovering files -- summary

Newsgroup: comp.sys.atari.st
Date: 1993-05-11 17:01:37 UTC
From: zimmermk@westford.ccur.com
Message-ID: <1993May11.170137.16094@westford.ccur.com>
Source record: 205984
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

This is the promised summary of responses to my appeal for help recovering
a deleted file. Thanks to all who replied! As I've noted, I wound up using
the sector dumper in TOOLS18 to find my data and the sector manager in
DFSUITE2 to copy the sectors first to memory and thence to a file. TOOLS18
is a nice package, and contains a sector editor; I'd been thinking that I'd
have to edit the FAT with this. DFSUITE2 is almost completely undocumented,
takes sector numbers in DECIMAL, and has unexplained options, but was sufficient
to copy the sectors off of the disk. Considering the alternatives, I don't
think that I can recommend DFSUITE2.

Subject: Re: Need help recovering deleted file!

See if you can find a program called 'Salvage' which will let you tell
the computer the start & end sectors of the data on the disk which it
will then turn into a file!

(Should be on the FTP sites or local BBS's!)

Subject: Deleted files

Hi,
just because you mentioned to need it TODAY...
I did what you described one day, at least i tried and tried
until i gave up on it. I remember that the FAT entries are
encoded in some way, like a 2/3 encoding w/ bit swapping or
such ugly things. There is a book existing on the internals
of the ST, a friend of mine had it that time. But enough of
the so
story: i do _not exactly_ have what you need.
One idea: as the file and FAT format are equivalent to these
of DOS, maybe you can try on a DOS PC...
Next idea: You already found your data in the sectors: this is
a great progress! (are there several copies of old versions of
the file? This point broke my neck in the past). couldn't you
just write the sectors out to single small files with your
disk-monitoring program? Then cat them together.
Third and fourth: i was just at the ftp-server atari.archive.umich.edu
(dont know if you know what it is, but:) here are two small

packages. the names sound like "undelete", might be useful.
I appended the uuencoded archives at the end of the mail. They are
separated by a few empty lines and a "-------" line.

So i say "Good luck!" and

Greetins from Munich, Bavaria!

Walter.

Organization: National University of Singapore

Hello from Singapore,

I normally used DISKDOCTOR program to peek into the disk or hard
disk and if the directory track still intact I simply use SEARCH
function to serch for PRG so it will go to the location where all
files are listed. The deleted files will have their first letter of the
file name replaced by E5. By replacing E% with the letter (any alphabet)
will make that file reappear on the directory.

Now in the case that catalog tracks of FAT is corrupted. There are 2
programs that I know of that can deal with the problem.

1. CHKDISK.PRG by Atari Corp has option to use FAT1 or FAT2 or to
replace FAT1 with info from FAT2. If you only corrupted the usual FAT1
then you may be in luck. This program als0 good for defracmenting the
hard disk. I think that you can find this program in the atari.archive.
It will not allow you to reconstruct the FAT though.

2. Knift ST is a commercial program but It was given away as a COVER DISK
by ST Format magazine last year. Article on how to construct the FAT also
explained in the Magazine. I have the magazine at home so I can not tell
you what issue it is now. I never have to go to the extend to
re-construct the FAT manually yet but from what I glance through the
article it is quite complicate.

Another article in ST USER (or is it also ST Format?) explained the method
of constructing FAT by keying in the begining of the file, file length,
etc using any disk inspection program (eg. DISKDOCTOR, STDOCTOR, etc) but
again I never want to try out so far.

Another program called "HDSENTRY" (Hard disk Sentry) is a utility for
hard disk but it also work with diskette. It will rectify the invalid
directory and sub directory and create new file name for you. I might
produce numerous files by the name of FIX XX.XXX then You can used Word
processor to edit and join them into correct file (if it is a Data files)

AAnother method is to put the disk into IBM computer and use PCTOOLS or
Norton Utilities to work on the disk.

I all cases do not work on original "Corrupted" disk but copy the whole
disk onto a new disk using copy program. Some time you might have to use
the copy program which can set to copy 'protected disk' to ensure that all
the error track will be on the new disk as well as that particular track
might contain some relevant data need for recovering.
the caase of DATA)) pisn used then 0xxx . severmame nmcdal" ssik '

From: Patrick BETREMIEUX <bpat@binkley.cs.mcgill.ca>
Subject: Re: Need help recovering deleted file!
Newsgroups: comp.sys.atari.st.tech
Organization: School of Computer Science, McGill University

A cluster is a group of sectors. On the ST, a cluster is 2 sectors.
Each FAT table entry is the cluster number of the next cluster in the
file, or FFF if it's the last one. Each entry is 12 bits long, which
makes for a weird format. Especially since they are written in Intel
format. Thus, for each 2 entries in the FAT (i.e 3 bytes), we get that
"12 34 56" decodes to clusters 412 and 563.
If you know which sectors to put together and in which order, the task
is relatively simple if you take care not to make mistakes (Better spend
5 minutes on a calculation and be sure of the result than to trash things.)
However, fear not. If you indeed make a mistake that you cannot undo (You
don't know what the previous value was for instance), then you can always
get the 2nd FAT (Located 4 sectors after the first) and copy it over.
Now, here is a sample session on recovering a file with:

track 30, sectors 3-4
track 30, sectors 9
track 31, sectors 1
track 32, sectors 5-6

First, find out how many sectors per track your disk has. It's 9 if you
formatted it with the desktop.

Find out which is the first data sector of the disk. Usually, it's the 19th.
(So track 2, sector 1 if you have 9 sectors/track).

Group the sectors you want 2 by 2. So we get:
track 30, sectors 3 & 4
track 30, sector 9 + tr 31, sect 1
track 32, sectors 5 & 6
For each, calculate it's absolute sector number in the following way:
[track #] * [sect/track] + [1st sector of cluster - 1]
Then get their cluster number:

([abs sector #] - 18) / 2 + 2
As you can see, you may have clusters going through the boundary of a track.
This gives us for our example :
129, 132 & 139
In the FAt, count 1.5 bytes per entry, starting at 0.
Get your clusters number in 12 bits HEX.
081, 084 & 08B
When you find where an entry goes, write THE NEXT CLUSTER'S NUMBER in this spot. Not itself. Thus, at cluster 081's position , write 084.
But take care to swap the bits around. If the cluster number is even, write the number 123 as 23 X1 XX (X stays as they are). If it's odd, write it as XX 3X 12. The last cluster gets FFF.
Thus, at offset 193, we write XX 4X 08,
at offset 198, 8B X0 XX
at offset 208, XX FX FF
And then use you program to create a file from this, or if you know the format of a directory entry, create it yourself.

Good luck.

Patrick.

There is virtually no limit to the amount of data a cartridge can hold (even
though the Falcon can only address some of it at a time). The real limitation
is the cost to produce software on a cartridge. Nintendo can do it because
they sell MILLIONS of them! Atari devs cannot afford the design and tool
costs based only on potential sales in the 100's. The last successful
Atari cart I recall was the Spectre GCR and Dave Small will gladly wax
eloquently for hours about the costs involved in THAT process. :)

>I wonder what would happen if these cartridges could be pirated.
>Would Sega sell them for $129?

Interestingly enough, many evidently CAN be copied. Dorothy's article makes
a mention of just such a device. I remember from my 8-bit days that there
was a device that allowed you to copy the info off most 8-bit carts onto a
disk for "archival" (yeh, sure) purposes. Rather like an EPROM reader.

>Yes, I guess there are a lot of ignorant Atari users out there.

When the last Atari dev switches to the pc, they'll get smart quick. ;-)

Having the full program on a cart is bad news. You would need to swap carts like mad. I am totally against the use of cartridges. How would you go about upgrades, it will make them very expensive.
In my opinion, piracy is here to stay but authors can do a few things to minimise it.

1. Encode the user name in the program.
2. Use key disks that can be installed on a hard disk.
3. Any other protection scheme that does not affect the usability of a program.
4. Press for better copyright laws in their country. This is something the EEC should start worrying about. After all, the sofware industry in Europe is vital to the Eurpean economy and should be better protected by law.

In addition, I have written an article about the subject in ST User - May 1993 issue. The best we can do is to convince people that they do not benefit from pirate copies because piracy slows the rate of new

products appearing on the market.

As a journalist, I can easily make copies of programs I get to review. I insist on paying for programs that I use, because I would like to get updates and be able to complain about bugs and ask for improvements. I believe that good programmers should be rewarded for their work. It encourages them to write more good programs.

All I have to do now is to convince everyone else that the best way of getting hold of software is paying for it. ST programs are not expensive.

The ST market is too small to be able to absorb losses to piracy. If we don't buy programs, there will be no programs next year...

SUNNYVALE CA: In a groundbreaking move, Atari Corporation and Commodore have announced a joint venture into the personal computer arena. The former competitors claim to have realized the futility of trying to compete against each other for "niche" markets and have decided instead to "team up and have a go at Big Blue."

The new computer is called the "Atiga", and is said to combine elements from both the ST and Amiga lines, as well as several new features. For starters, the new machine will be based on the Intel 80286 processor. "The 68000 family is dead," claims Atari's Bob Brodie. "The original plan was to make the Atiga PC compatible, but about halfway through the project Jack Tramiel decided on a new operating system based on the HP-41 handheld calculator." Text is entered in a modified RPN (Reverse Polish Notation) in which words are entered first and then all punctuation is added at the end of a sentence. "It's much faster when you get used to it," claims Brodie.

In addition, the Atiga is said to borrow sound and MIDI capabilities from the Amiga line and graphic capabilities from the Atari ST. "We wanted to build on the Amiga's success in the music market and the ST's popularity with video production companies," said a Commodore spokesman.

The Atiga will be available in two configurations. The first is a one piece model with integrated monitor, keyboard and CPU. The one piece model ships with no RAM, though an Atari spokeperson mentioned that he thought that RAM boards might be provided by third party manufacturers at some future date.

The second configuration features a CPU and a unique Direct To Brain (DTB) interface. Although still in early testing, the DTB interface is connected to the user via two probes and I/O is established through a combination of brainwaves and biorhythms. One probe is attached to a collar fitted around the user's tongue, but spokepersons would only giggle when asked where the second probe was connected. When asked about the RAM configuration the spokespersons replied "Yes, that's correct," and broke into hysterical laughter.

In an unusual move, the two companies have announced the availability date of the computer to be three weeks ago, with production scheduled to begin by next fall. In the meantime, a media blitz is planned to start immediately with print ads in supermarket tabloids and video spots in trailers for adult videos. "We're really excited about this one," said the Commodore spokesperson. "Yes sirree Bob." "What?" replied Brodie.

Piracy is wrong. No ifs, no ands, no buts!

The fact that the IAAD put out an article that demonstrated that people
are willfully placing copies commercial software on BBSs and encouraging
others to just take a copy has obviously hit close to home for some. People
hate to be called dishonest but if you are in possesion of pirated software
you are stealing from those that are selling the software. And therefore
in at least this one instance YOU ARE DISHONEST.

John Hutchinson is absolutely correct, the IAAD article does absolutely
no harm, except possibly to the conscience of those that have software
but do not pay for it.

I personally used to have a pirated copy of Publishing Partner, and
TurboST. I have legit copied of Pagestream, and Warp9. Why did I buy
these things when I know where to get them for "free?" I WANT NEW
PRODUCTS AVAILABLE FOR THE TT and FALCON.

If we do not pay for the software we use how can we expect developers
to support the Atari platform? Commercial developers will not spend time
making new products that will not make money. Then if there are no
supported products no one will buy the computer, then the computer will
not longer be produced.

Does any of this sound familiar to anyone?

Minor problem with that idea. You _don't_ get Atari Works, SpeedoGDOS, or the
D2D "demo" w/o buying your Falcon w/ a hard drive.

Just minor, but still a problem.

Source record: 206005

```
] There are no different versions for the 68000 and 68030 - although I woul
] find this quite good.

There is (or was) 2 different versions, an 68000 version, and a 68030
version - the current version has the code for both apparently merged
into one program which uses the appropriate code for the processor
in use.

Current version is supposed to be 1.04.
(The same version of MiNT that it's using, which causes the pretty
error messages to print on the screen all over your work 8-)

The overall size of M-TOS is under 1meg, (somewhere around 900k).
Although it does take up a fair bit more RAM & diskspace (at least
2meg of disk-space for it's pipes etc.)
```

Populous (and Populous II) can play across a Null-Modem connection, and one can mix architectures (amiga-st, ibm-st, amiga-ibm). Falcon can also use a Null Modem, but I am not sure about architecture mixing. Stunt Car Driver (sold as "Stunt Car Racer" in the state, I believe) is another Null Modem game. Midi Maze and Midi Maze II can (obviously) use MIDI cables.

All of these games are great! Stunt Car Driver and Midi Maze 1/2 really need to be played with multiple machines (they are both a bit dull on a single machine, IMHO). Populous 1/2 and Falcon stand alone as some of the best ST games every written. If you get as addicted to Populous as I did, you will be searching hither and yon for modem competition (it is quite playable at 2400 baud, and transparent at 96k).

By the way, now that you have an STE, you MUST get the Omega 92 demo and check it out. It is absolutely mind-numbing (and does not run on my Mega2st :-( ). If you cannot find it, let me know and I will put it on atari.archive.

While installing TOS 2.06 in our user groups 1040 STe, I noticed two locations on the the mother board which are marked for a crystal and a number of resistors and capacitors, but the components are not installed. One area is on the left side of the mother board about halfway back while the other one is at the back on the motherboard on the right hand side near the DMA, serial and printer ports. These areas are marked for crystals Y100 and Y101 respectively. Can anyone tell me what the intended purpoase of these components was and why they were not installed"? Also what is the function of the E0 thru E7 jumper pads near the TOS ROM's?

I guess the Falcon is selling well, because Atari can only supply 10 Falcons per day in the U.S. If Atari trys harder, they can supply 20 per day, but it will take a great effort on Atari's part....

$1299.. for a non expandable 16 mhz Falcon.....Not!!!!

Yes, but there is only room for a single hard drive. That's all, no more.
If you want a second Hard Drive, you have to use the SCSI-II port on the
back. Not that anyone's complaining, the SCSI-II is much faster than IDE
anyway. But, you gotta decide...

6881. ST for sale

Newsgroup: comp.sys.atari.st
Date: 1993-05-12 06:44:46 UTC
From: fymah@essex.ecn.uoknor.edu
Message-ID: <C6wIqn.F3v@constellation.ecn.uoknor.edu>
Source record: 206023

**********For Sale**********

Since I have been getting offers to split various components, here is a listing of asking prices for the components

ATARI MEGA ST2.....$350/obo
Atari Mouse, Keyboard

Color Monitor (SC1224).....$150/obo

ICD 48meg hard drive (Seagate, dual HD case)...$275/obo
Various Utilities on drive(graphics, sound, etc.)

All Original Boxes

Software includes:
Word Writer ST / Swiftcalc.....$15
Timeworks Publisher ST.....$20
GFA Basic/Compiler 3.5.....$50
MasterCAD.....$10
Tiger Cub.....$15
MIDI Recording Studio.....$10
GFA Raytrace.....$15

if you buy 4 or more of the above, I will subtract 25% from the price
$90 will take all of the above

GAMES:
These three are in one game pack.....$15
Blood Money
Rocket Ranger
Speedball

Shadow of the Beast.....$5
Falcon (1.0 and 1.2, mission disk 1)..$20
Alien Syndrome.....$10

$35 for all the games
I would prefer a minimum of 3 software titles per person to make shipping easier

Asking $800 or best offer for all of it
Buyer pays shipping

Email me at fymah@essex.ecn.uoknor.edu
I may not be able to respond to inquiries for a few weeks since I will probably not have mail access for a while.

Sorry, I think you missed something. I was referring to the
Atari Works, SpeedoGDOS, etc. Since the $1300 version comes with the hard
drive, he _does_ get that software.
Granted, you can only fit one drive inside the machine, but wouldn't
it be workable to run a long cable out (I belive I have heard people running
cables above the floppy drive or some such) to an external drive with a
"slave" IDE? To be honest, I still think the best thing to do is to leave whatever drive
you get (or not) in the machine, and just use the SCSI-II port
for any future HD upgrades - much easier on you _and_ the machine, while
not being that much different in price, and you don't have to give up any
previous drives. Oh yeah, and it's faster. :)

According to Sam Marshall (article 40392) there is a utility 1WP2RTF
which helps to convert WordPlus documents to WordPerfect and back.
Also a cheep version of Redacteur would do this conversion.

Questions:
- Where can I find 1WP2RTF?
- Where is Redacteur for sale for 60 US dollar?

Your posting came thru fine in gnu.misc.discuss.

You wrote:

> I was just wondering if GNU supported a `small' shell for the atari ST.

I don't know if there's a GNU sh and whether it has been ported to the Atari ST, but I do know that there are ports of the BSD Bourne shell `sh' to the ST are available from atari.archive.umich.edu:/atari/Mint/Shells, among other places.

I've done a port of this BSD sh (from the 2nd BSD Networking Distribution) myself, and this one actually works quite well. I haven't uploaded this port yet, but I'll do that as soon as possible. Watch out for a posting in comp.sys.atari.st advertising the upload.

Michael

I've just had a quick chat with Marpet (can't talk too long with the current phone-rates for out-of-contry calls ;-). Really nice guy! The price for the unpopulated MSTE-expansion is GBP 99.95, and the card has a VME-thru-port. It's supposed to start shipping next week.

Someone mentioned to me that memory on the VME-bus is slower than normal ST-memory. I'd like to know just HOW much slower it is. Does anyone care to guess, or even better, does anyone KNOW how much slower it would be compared to normal ST-memory.

Daniel Eriksson (m91der@tdb.uu.se, den@hgs.se)

But you will only get half the storage capactity. Not?

>The main problem with adding a second drive is the Megafile's
>power supply and the fact that you need drivers that look for a
>second drive in the Megafile. (AHDI won't do that!)

Yeah, I wondered about that. When I boot my Megafile 60, the HDdriver
looks for some 0 and 1 unit, of which only the 1 is present. Isn't the
1 unit the extra drive that can be fitted in a megafile?
I bought my Megafile second hand and always thought I was using AHDI,
but I could be wrong.

6894. ST-ZINE disk mag construction kit now on Atari Archive

Newsgroup: comp.sys.atari.st
Date: 1993-05-12 12:45:43 UTC
From: evilandi@vnet.IBM.COM
Message-ID: <19930512.045914.977@almaden.ibm.com>
Source record: 206028
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My disk magazine construction kit, ST-ZINE, is now on Atari Archive. It works on any Atari ST/STE up to TOS1.62 (update for further TOS versions to follow this summer), colour or mono, any disk drive, any ram.

To get this utility in uuencoded .zoo format, send a note to:
<atari@atari.archive.umich.edu>
with the first line of the message reading:
send Magazines/stzine.zoo
The file is about 120k long.

This utility allows you to create disk magazines consisting of text, picture slideshows (mono and colour) and tracker music (colour users only). No programming knowledge is required; all you need is a wordprocessor.

The manual is provided in the form of an example disk magazine. Double click on SHELL_33.PRG to run.

ST-ZINE is shareware and costs 5 UK pounds plus a disk and SAE to register, but special offers exist for overseas users to avoid currency-changing problems. See the manual for details. There are currently over 30 registered users in the UK, mostly user groups and special interest clubs.

Please download ST-ZINE to PD libraries and indeed everywhere. Comments about this utility are welcomed by email.

aa399@cleveland.Freenet.Edu (Len Stys) writes:

>If Atari wanted to end piracy, they could have by making the Falcon030
>with a cartridge port that could hold a lot of information.

Good idea, but that would make the cartridge port incompatible with the one on the ST, and it makes distributing updates a lot harder. And cartridges can also be pirated. And are pirated. I don't know if there are pirated cartridges for the Lynx (I think not since the cartridges for it have an elegant and very slim design) but newspapers even have advertisements for pirated Nintendo cartridges.

>Just imagine Word Perfect on cartridge. There could be a small box
>under the monitor that allowed the user to press a button for the software
>he or she wanted.

Price of updates would probably sky-rocket. And cartridges can be copied. No the only thing that would make cartridges reduce piracy is because of the extra convenience they offer. Extra convenience for users is one of the few effective weapons available for developers. Look for example at the excellent net support available for PD, shareware and commercial software. Think for example of Ian Lepore who answers questions about the Heat 'n Serve C Compiler, WOlfgang what was his last name again? who will gladly answer any questions about Connect and John Hutchinson who is on the net also because he wants to keep in touch with his customers. If any of these people think they don't do this :-) please follow-up :-)

>But I don't believe that "software costs so much because of piracy"...
>Take a look at a Sega Genesis cartridge. They sell thousands and
>thousands of these cartridges and for $59 to $79.
>I wonder what would happen if these cartridges could be pirated.
>Would Sega sell them for $129?

These cartridges can be pirated, but the ordinary users will have great troubles doing it. No the reason for these high prices is the high marketing costs they have and that they need to make lots and lots of money to satisfy their stockholders and of course a Rolls Royce for the company president won't hurt either.
Oh and Atari software is comparatively cheap.

Erlend.

Netlanders,

I have the following for sale:

Price Item
----- ----
$75 SM124 Monochrome Monitor
$275 Spectre GCR w/ROMs and version 3.0 of software
$400 80 Meg SH204 Hard Disk

$20 Diamond Back II (works with GEM and GCR parititions)
$50 Laser C and Debugger
$50 PageStream (2.1)
$20 Lemmings
$20 Falcon and Mission Disk

$15 Atari ST Application Programming by Pollack & Weber
This out-of-print book provided me with excellent information on
programming the ST.

I also have a dead (maybe just power supply problem) 520ST with an Aerco
2 Meg upgrade (total 2.5 Meg), ICD AdSpeed 16MHz Accelerator, and TOS
1.4. I would accept offers for this.

SPECIAL OFFER: A free software program with docs with any purchase. I'll
throw in something I bought while owning my ST for free.

All prices do NOT include shipping. I will ship COD or after payment has
been received.

ricy@microware.com

Don't forget about "Cyberdrome-The Hoverjet Simulator." It was _designed_
for two-player/two-computer play using modems or null modem cable (a lot
faster data transfer than via MIDI cables).

For more info on CYBERDROME, send an email request to hutch@ilmen.lanl.gov.

Mmmm, are you sure? I shouldn't think that it will be slow since the
VME-bus is directly connected the bus. (JG)
The only way it could be slower was if it was accessed as ST mem (ie The
graphics and DMA chips are allowed access to it), but since you NEED tos 2.+
to have this mem, I would have thought it was installed as TT mem, and so
faster than normal ST mem (NS) -Please correct us if we're wrong (Naaa..)

Well, I am finally bidding adeiu to my trusty Atari 520-ST. Since I sold my SpectreGCR (A TOP-NOTCH product by the way). It mostly collects dust, and I am returningnit to its owner who long-term loaned it to me. Anyhow, I have an ST emulator for my Amiga, but it will not operater without the 1.2 TOS image. Being out of touch with the ST world for a year and a half now (since I got a short-term job with Commadore, and then started my own video consulting business) so I don't know if any newer versions have come out, making 1.2 no longer attainable, and as I recall, 1.2 was never released on disk. Any one have some ideas that could help me out? And please no flames about becoming an Amiga user, I am really a multi-platform kind of guy, and that's why I still want the ability to access some of my Atari applications.
Respond via e-mail please.

Thank you...
Bill Mills

I recently purchased a 2nd TT that was having some TT ram
problems during a cold boot. The problem turned out to be the
person I bought it from had populated the TT-Ram board with 100ns
SIMMs. I have replaced the SIMMs with 70ns versions but I am left
with 4 1megx8 100ns access SIMMs. These will work in any STe or any
ST that has a SIMM compatable upgrade.

I am asking $120 for all four, I pay the shipping.
Before everyone starts flaming the price the best price
I found for these has been $40/SIMM ($160) and the buyer
pays shipping. So if you do not like the price just do not
respond.

If you are interested please send email.

I found the D.A. Brumleave article very well written, very informative, and even a little bit shocking. I'm an 8 bit veteran, and I remember being involved in the Piracy scene oh about 8 years ago. Things have really escalated from then. High speed modems, multiline, networked BBS systems, and highly organized gangs of pirates have really worked to spread piracy and pirated goods worldwide. I think Dorothy's article is terrific, and I applaud her for all the hard work she's put into the article, and the fight against piracy. In my opinion, the more pressure that can be put on the pirates, the better. Hiding serial numbers in the programs, so that a pirated copy can be linked to the original purchaser seems like a good idea. If people know that they'll lose support, and possibly get a phonecall from an upset developer because they uploaded their copy to a BBS, at least a few people will be deterred from copying. Another thing that really shocked me is the aggressive, and elitist attitude of the hard core pirates. The whole section on how you'll lose access and stuff if you don't continually upload new "warez"... man it made my hairs stand on end. What worries me is that this problem seems to be starting to take on the scope of illegal drugs. How can you effectively work to wipe out such an epidemic?

6911. Falcon030 Net Port

Newsgroup: comp.sys.atari.st
Date: 1993-05-12 20:08:06 UTC
From: neurom@u.washington.edu
Message-ID: <1srlf6INNgkc@news.u.washington.edu>
Source record: 206042

I was wondering, I know the F030 comes w/ a LocalTalk port, but does it come with any software that allows it to use it? Is there a .CPX w/ network drive mounting?

Reason: There's a whole bunch of Mac's here at school, and if I can just get files on the Mac a INet speed, then just hook up the Local/Apple Talk and transfer them to the F030, that would be _very_ nice.

Just wondering.

6912. Re: PAGESTREAM III

Newsgroup: comp.sys.atari.st
Date: 1993-05-12 20:10:15 UTC
From: nelson@titan.PPD.Kodak.COM
Message-ID: <5162@eastman.UUCP>
Source record: 206102

SoftLogik, on their SIG on GEnie, said that they wouldn't make a decision on PageStream III for the Atari platform until the Amiga version is released. It all depends on Atari's sale of new machines and the potential for initial sales of the new package. They said that upgrade fees alone would not provide sufficient financial incentive to do the port.

>Well,there is no way... A midi file contains ONLY sequence info.
>It had no sounds. To play it,you need a MIDI expander or synth.

The best shareware/freeware program I've seen for playing .MID files via the internal sound chip is MMM, Midi Music Maker, which should be available on atari.archive. It makes no attempt to reproduce the original sounds, but you will hear the right pitches and rhythms. It also plays about 30 other types of sound files...

6919. Speedo Fonts ....

Newsgroup: comp.sys.atari.st
Date: 1993-05-13 00:08:18 UTC
From: baffoni@phakt.usc.edu
Message-ID: <1ss3hiINNecu@phakt.usc.edu>
Source record: 206103

Hi all,

Now that I have a working TT, I have been seriously considering
purchasing the Atari Works/SpeedoGDOS package.

I assume the SpeedoGDOS comes with a few starter fonts, and I am
sure that I will "outgrow" them quickly.

Does anyone know of a site with PD Speedo fonts? Does anyone know
of a ATM->Speedo converter (at least ATM1, maybe ATM3) or a TrueType->Speedo
converter program - for IBM/Mac/Atari?

I was playing with the SpeedoGDOS at the local atari store and the
techs were too busy to answer this question - how do you get SpeedoGDOS to
recognize old-type fonts (I was using the connlght font from CoNnect)? The
outline program only scanned in the speedo fonts.

I think I asked this before, but (besides the pagestream font format
that is the standard), does Speedo use any other type of fonts?

-MikeB

6920. Striker

Newsgroup: comp.sys.atari.st

I don't know if anyone has encountered this, but when I play Striker, it is not that uncommon for both teams to have exactly the same colour kit. Bloody annoying!

6921. Prinecton Ultra 1600 multisync for sale

Newsgroup: comp.sys.atari.st
Date: 1993-05-13 00:23:03 UTC
From: aq115@cleveland.Freenet.Edu
Message-ID: <1ss4d8$4eo@usenet.INS.CWRU.Edu>
Source record: 206104

For Sale:

Princeton Ultra 1600, 16" multisync monitor:

Scan rate: 15.6 kHz to 36 kHz (H)
40-120 Hz (V)

Dot Pitch: 0.31 mm

Features: Overscan/underscan switch
1024x768 interlaced max res.
Text color switch (normal/green/red)
All controls on front panel
NO nasty borders -- image fills entire screen
Original box and manual

Unit is in excellent physical and working condition. I'm selling it because
I need the money more than the monitor -- I'll go back to my 14".

$550 plus shipping (FedEx Economy if COD, your choice if prepaid).

Please Email me if interested.

>to "team up and have a go at Big Blue."

>The new computer is called the "Atiga", and is said to combine elements
>from both the ST and Amiga lines, as well as several new features...

Fortunately, the merger between Atari and Commodore has broken up
after furious debate over what the machine should actually be called.

Atari officials want "Ataga" and will settle for "Amari", but
Commodore demand "Amiri", or "Atiga" at the very least.

Meanwhile, IBM have announce the final name for their Pentium-based
machine. It will be called "Computer". VGA will be renamed to "Graphics".
Simultaneously, Microsoft have renamed themselves "Software", MS-word
is renamed "Word Processor", and "MS-DOS" is renamed "OS". Spokespeople
from both companies have stated that the name changes are to avoid
confusion in the marketplace, since the new names are the more common
terms.

Well may be they need to go out and SELL IT, this is one of the big problems with USA software firms, they rely to much on there home market, but there is very little Atari home market.

When we had a Agent here Pagestream was not pushed at all, one big problem here was the price was far to high, to many distributors in the chain, so most people got there copies from USA mail order but the problem there is No English Dictionary..

So SoftLogic get of you bums and get out in the World and SELL SELL SELL..

Tell me chaps how many Ataries are there out there..?? more than 2.000.000 from what I have read, isnt Pagestream the easyest DTP there is for the Atari, so there should be at least 1.000.000 copies out there, real copies that is..

So Softlogic don't blame the Atari market, just blame your self for not pushing a good product..

On such conversion subjects, what format does the Portfolio store its text files in. It appears to be plain text without any line seperators, which makes things rather awkward.

Is there a program that will automatically expand (insert tab's), and reformat text files (with efficient word wrapping), to a specified column size? (Or even if only 80-columns...)

I can't imagine this being all that difficult, so maybe some enterprising programmer out there has some spare time & would like to help us (me 8-) Any takers/information?

] of a ATM->Speedo converter (at least ATM1, maybe ATM3) or a TrueType->Spe
] converter program - for IBM/Mac/Atari?

Apparently, the bitstream fonts are actually commercial. So if you want
a particular type of text, you have to pay for it! Rather nasty....

If this has changed, I may of course be wrong!

It also, will load in (apparently once more), the older GDOS type fonts.
But with severe limitations. (Again, subject to correction as I have
not used the prorgam)

Source record: 206114

HELLO, USENET!

Well, so much for abject camaraderie.

I'm planning to upgrade my Megafile 20 harddrive by replacing the drive mechanism with a larger mechanism. The mechanism is a Seagate ST225, and the controller is an MFM controller (Atari has some kind of converter in there to convert MFM to ACSI, I beleive.). What I'm planning is: get a larger MFM or RLL drive, and just put that where the ST225 was, give the Atari Hard Drive formatting program all the info about my new drive via the parameter file (forget what it's called right now), and it should work.

Anyone with suggestions, or relevant experience at this kind of thing, if you could comment on this, it would be greatly appreciated. Also, I'm looking for an MFM hard drive to use for this purpose.

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
Ive got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham or Ladbroke Grove
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you cant say fairer than that, can you.

Leave a message on 081-693-2846 and Ill get back to you
as soon as possible.....

palm_erd@csusys.ctstateu.edu wrote:
: [...] info on installing the latest version of Mint [...]
: Thanks.

Dear ... , (whoever),

the latest version of MiNT -s (as far as I know) - should be 1.04. It is a source-code-only-release. I read something about an anouncement of a version 1.06(?).

There ar some (a number of) compilers which should do the work. I tried it out with the GNU-CC (gcc-2.3.1) on a 3-Meg-Byte ST (1040STf). But it was mentioned in the readme-section that Lattice and another compiler (I can't remeber it's name) will work.

If you want to compile MiNT1.04, you need nothing but the sources and the (a) c-compiler. But to take advantage of MiNT's multitasking-features, you might need a shell, and toswin.acc (or stuff like that: e.g. mw ...). It might also be a good idea to ftp a copy of the mintutils which were posted once with the MiNT0.95-release.

This Information comes with no waranty ...B-) .

Yours, Jan.

|>If Atari wanted to end piracy, they could have by making the Falcon030
|>with a cartridge port that could hold a lot of information.
|
|Good idea, but that would make the cartridge port incompatible with the
|one on the ST, and it makes distributing updates a lot harder. And
|cartridges can also be pirated. And are pirated. I don't know if there
|are pirated cartridges for the Lynx (I think not since the cartridges
|for it have an elegant and very slim design) but newspapers even have
|advertisements for pirated Nintendo cartridges.

Using a cartridge port seems like a pretty bad idea to me.
You can only insert one cartridge at a time; that was not wat
MultiTos was developed for was it?

At the online conference on the Cyrel graphics board the people that
sell this board also told that they made a serial mouse manager that
will allow for connecting most serial mice and also digitizer tablets.
It is commercial, but I have also seen a PD or shareware program that
will allow just mice. Might be a bit harder to get though.

Hi David,

i have never seen a version of GULAM which worked without
throwing lots of bombs. I know there is some source code
around and many people *tried* to debug it, but i know
of no succes.

If you need a small shell try MUPFEL from the GEMINI system.
I use it every time my OKAMI uses too much memory.

I second that. All of the space invader type programs at atari.archive.umich.edu are pretty lame (one even locks up on a certain screen). I have yet to see a good space invaders clone (color), or a decent galaxian copy (Nova doesn't count).

6950. MDK documentation update

Newsgroup: comp.sys.atari.st
Date: 1993-05-13 14:00:14 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <1993May13.140014.20941@sol.ctr.columbia.edu>
Source record: 206129
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just sent the following mail to Jeff Weiner at a.a.u.e:

Documentation (in a file called MDK.upload.tar.Z) has been uploaded
to a.a.u.e. The following is a list of contents:

```
phlem:sjg> tar tzvf MDK.upload.tar.Z
drwxr-xr-x sjg/users 0 May 13 13:48 1993 Doc/
-rw-r--r-- sjg/users 743803 Feb 23 15:25 1993 Doc/readme.ps
-rw-r--r-- sjg/users 27402 Mar 1 17:28 1993 Doc/readme.asc
-rw-r--r-- sjg/guest 1454 Apr 14 02:36 1992 Doc/minixfs.doc
```

The important one is minixfs.doc - this is required to be part of
any distribution of minixfs, which wasn't the case with the MDK.

If anyone has an ftp-able copy of the kit, and it isn't mirrored
from a.a.u.e, please copy the new docs (the only one that's changed
is the addition of minixfs.doc) or you'll be in breach of copyright.

Simon.

that file is called WINCAP. This will work with sveral drives.
You may have to change some jumpers on your Megafile controller board
if you take a drive that requires write precompensation or so.

I have done this several times and had no problems. I may be
difficult to find a MFM drive these days.

Bye Wolfgang

No opinion offered on your statisics, except I find it hard to believe that
one could imagine every other person who owns an Atari has a need for vertical
software like Pagestream.

>So Softlogic don't blame the Atari market, just blame your self for not pushing
> a good product..

Wrong again. SoftLogik has gone far out of their way to develop software for
the ST, probably out of some sort of loyalty for copies of Publishing Partner
purchased. SoftLogik is a business. You can't expect a business to throw in
with a machine that is falling into a black hole. I've seen SoftLogik working
ComDex, various ATari shows, really hawking their wares, with extravagant
full-color brochures. It's certainly not for lack of trying.

>costs based only on potential sales in the 100's. The last successful
>Atari cart I recall was the Spectre GCR and Dave Small will gladly wax
>eloquently for hours about the costs involved in THAT process. :)

Do you think Nintendo sells millions of one game cartridge?
No, they have many cartridges.

Maybe Atari could put the software on cartridge. Of course, developers
would have to pay Atari to do this, but they would save money by it
not being pirated.

I think Lynx developers make the software, but then Atari manufactures
the game cards. I don't know how it works out though.

>
>>I wonder what would happen if these cartridges could be pirated.
>>Would Sega sell them for $129?
>
>Interestingly enough, many evidently CAN be copied. Dorothy's article makes

>was a device that allowed you to copy the info off most 8-bit carts onto a
>disk for "archival" (yeh, sure) purposes. Rather like an EPROM reader.

A lock out chip could be placed in the cartridge to prevent copying.
Also, if the cartridge is really big, over 2 megs, wouldn't it be hard
to copy to disk?

>
>>Yes, I guess there are a lot of ignorant Atari users out there.

I have one that is wonderful, E-mail me with you address and stuff and I would be happy to E-mail it to you. This goes for anyone else who would like a copy. It looks and plays just like the old arcade version, atleast I think so. I have yet to find a good galaxian clone though also. Please post here if you know of one.

It is true, a friend of mine took almost a year to realise he had a HD
drive. Don't remember which DIP switch it was.

Ofir ogal@cix.compulink.co.uk

Experience is something you don't get until just after you need it.

I'm not, I doubt the average sales assistant in either of these shops
would realise that a 'falcon' is an animal of some sort. Sometimes
when I'm in Dixons and a sales assistant asks me if he/she can help I
get an almost uncontrollable urge to say 'I sincerely doubt it', or
'I'm afraid not'.

Anyway, I suspect that only the bigger (and more clued up) shops will
have Falcons in the near future, does anyone know of any major shops
that have them?

In article 3i1@usenet.INS.CWRU.Edu, aa399@cleveland.Freenet.Edu (Len Stys) writes:

>Do you think Nintendo sells millions of one game cartridge?
>No, they have many cartridges.

Yes, according to a recent Wall Street Journal article, they do indeed sell millions of a _single_ game cartridge. Super Mario Bros was one cited.

>Maybe Atari could put the software on cartridge. Of course, developers
>would have to pay Atari to do this, but they would save money by it
>not being pirated.

Well, developers would have to pay _someone_ for the extra cost of cartridge based software, but the users would be the ones who would end up paying for it. And according to this thread, most users seem to be very much against the idea.

>A lock out chip could be placed in the cartridge to prevent copying.

That would work for awhile, but no security system is totally secure, eh?

>Also, if the cartridge is really big, over 2 megs, wouldn't it be hard
>to copy to disk?

Not necessarily, compression techniques would allow floppy storage or it could be ported directly to a hard disk. Remember, where there's a will...

>Most <Atari> developers are gone, where have you been?

You're right, Len. I guess I'm just one of the few "stupid" ones left who is trying to continue support for the Atari community, even in the face of rampant piracy and such "encouragement" as yours.

I just uploaded a great game, Galaxian to Atari archive.
It is the licensed shareware version. It is called galaxian.lzh (original
name, huh) and it is in /atari/Games/

Also, I uploaded TeraDesk 1.30 the replacement desktop to Atari archive.
It is excellent.

It is in /Utilities/Desktop and is called tera_130.lzh

I highly recommend both.

InfoGrames: T.N.T.
Gambler Set

There are archival copies of almost every programme listed here. Also, I have about 50 or 60 blank diskettes. Also, while all of the programmes listed about are on their original floppies, much of the documentation has been lost in a lot of moving around. In my previous life I helped to preview software there is a litteral ton of old pre-release and demo copies of everything from word processors to games.

Most all of the hardware works, but could use a run through the shop to
be
cleaned and checked out. While I would rather do that my fiancee has
refused
my desire to purchase a Sun 3/50 or Apple Lisa until I loose some hardware.
So my 286 is off to my mother and this ST stuff is up for sale.

I will entertain most any offers. However, I would prefer, who wouldn't,
to
sell all of this in one or two bundles. Otherwise the post office my know
me
by name. I will absorb shipping costs anywhere in the contiguous United
States. My minimum bid for the whole package starts at 600$. Also, if you
take the whole bundle I can forward another SC1224 w/o cover when it
arrives
from storage [at no charge]

thanks,
Christian

Message-ID: <C6zuvG.24M@ucunix.san.uc.edu>
Source record: 205909

I have a Supra 20 MEG hard drive that lately seems to have a mind of it's own. When it is sitting patiently while I am doing something else, it will begin to "reading" and sputtering (sounds like I am rebooting my computer) about until I turn it off.

Any ideas why it is doing this? Any ideas how I can fix it?

Thanks for you help....

--Kevin
[klasmekj@ucunix.san.uc.edu]

6976. GEnie.

Newsgroup: comp.sys.atari.st
Date: 1993-05-14 03:53:00 UTC
From: jeff.spink@uttsbbs.uucp
Message-ID: <1776.78.uupcb@uttsbbs.uucp>
Source record: 205920

Does anyone out there use GEnie? I was reading about it, and saw those $8 an HOUR charges... which seems really ridiculous to me. But then I was reading something else which said that it was $8 a month, and no hourly charge if you don't call during the Prime hours. Nowhere could I find what the Prime hours were though. So basically, what I'm asking is: Does anyone know the EXACT rates, and if it's really worth it? Do they have a file x-fer area, or is it all messages? What? I have no idea what the place is all about, as I've never called.

A couple of questions:

1) Will an ST hard drive run on a Falcon? I've got a MegaFile 44 (Removable 44 meg cart's) and really do NOT want to have to make this useless, I know that the Falcon uses the IDE HD controller, but also think that there is a SCSI port, will I be able to connect the MegaFile through this?

2) Anyone heard the latest on the 486 emulator? Is it done yet? Is it any good if so?

3) Anyone know when the hell the Falcons are gonna be available in the US??

According to the new Current Notes, PS3 will only be released for the Atari
IF they sell a lot of Falcons. It is said that the ST can't handle all the
colors and graphics of 3. Personally I think that's a load of rubbish, I use
SL on a MEGA ST.

Yeah, a friends of mine tried to install some of those X fonts and it just didn't work. But, as Speedo is a practically *DEAD* standard, ie noone is using it anymore, things should change now that Atari users is getting this as a standard. I just can't see that the old Speedo policy is in harmony with Ataris ignorance of powerusers. I mean, who is there to actually *BUY* expensive Speedo fonts from Bitstream? Your average Atari user to whom this technology is offered? NOPE!!! We can only hope they release some cheap fontpacks and that there will be converters available. Saw an ad in MacWorld today from Bitstream where they offer two fontpacks with Star Trek fonts - in Type 1 format (for the Mac, but they probably have it available for PC's as well). Has anyone heard rumours about these fonts appearing in Speedo format? They were only $20 each, too...

Source record: 205911
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

-> If your Amiga OS allows you to read all disk formats, then good. Ours
-> doesn't simply because we never needed it, and so no one ever wrote
-> anything to do so.

YARK!! Atari world is so closed that nobody needs to exchange with
other platforms ??

Today, it's impossible to live in such closed world ...

... if you just play games, ok, no problem !!!

But, if you want to print on a laser printer service running on a PC, or
you need to include an EPSF drawing from your friend that have a Mac, in
your word processor ... if you can't , big troubles !!!

And, such things are very very frequent !!!

Just a simple example :

When i am doing FTP, i ALWAYS copy files directly form the Sun's floppy to
a MS-DOS Disk, and i read them directly with my Amiga ...

I think that all people that needs to do many normal things with their computer
AVOID to buy a ATARI ST/STE/TT/FALCONVAPORHARDWARE 'cause they know that
computers can't ...

... other that buy ATARI don't care what others do, they don't know frequently
what AMIGA/MAC/PC do !!!

-> How many Amiga users run their WP in full 4096 color mode ? OK, maybe
-> they will use it for games, but that's about it. And if you don't want
-> to play games, you bought an expensive piece of hardware for no reason
-> whatsoever.

Very ridiculous !!! ;-)

The coprocessors of Amiga aren't so expensive ...

... and, see what xVGA do, and look prices. Look also WHO HAVE a VGA on PC.
Almost anybody ...

i didn't think that Amigas will be less expensive if you eliminate the
4096 modes ! ;-)

That's a very good idea to C= for have place such possibilities in ALL
AMIGAs. The software makers didn't ask them "will i use these modes" ?
THEY USE-IT !!!

And, in opposition to ATARI computers, all these colors on AMIGA have
professionnal applications and using. I think you know well DESKTOP VIDEO
and MULTIMEDIA.

-> But on the ST, if you wanted it from the start, you would have bought
-> the required hardware along with the machine. And what you don't need,
-> you don't pay for.

HEY! ;-) 4096, and now 16 million of colors ar NORMAL configurations today!!!

Perhaps not on ATARI, but on ALL other platforms you need only some peanuts
to get thems ... ;-)

I did not think that computers will be very less expensive without it.
The difference isn't so big to not get these colors ...

... and on ATARI, if you get these card ... how many softs support them??

-> I've had my ST for 6 years now, and I still like it a lot.

I have an Amiga since 1986, and i have choose it considering also ATARI.
But it was definitely CLEAR to me that ATARI ST offers ALWAYS less than
Amiga computers, on Hardware AND on OS.

When you try an Amiga ... you didn't want to exchange it with a PC, a MAC
or a ST! ;-)

You get many things unavailable on others computers, and you won't loose them.

-> If the computer had indeed been well made, you wouldn't have to change
-> it every year.

Very stupid! ;-) NO COMPUTER IS PERFECT (don't try to say me that your ATARI
is perfect ... i can go with an AVALANCHE of cheap things on it), and all
users have many advantages to upgrade their systems !!!

Seriously, that's very very alarming for ATARI users to see that ATARi isn't
able to release his computers ... it's for when the FALCON ??

And, nobody change is Amiga at every year ....

... i have change mine this year, form an A500 that i've owned since 3 years, toan A1200
that i will surely keep 2-3 years.

All new features, as AGA graphics processors on A1200 and A4000 are very
attractive to many users, and it's normal for them to want buying one! ;-)

-> Buying a TT or Falcon is another matter.

TT have technologies of yesterday ... not interesting at all !!

(YARK !!! What a PIZZA BOX !!!!!)

Falcon, can you buy one PRESENTLY ???

Falcon is technology of tomorrow for after-tomorrow ... with promises to
be relaesed yesterday!!!

The important thing is to be satisfied with youe computer, same as you said!

But, try seriously an Amiga 1200, and i sincerely think that you will never
want your ATARI again.

Armour Geddon by Psygnosis
can be played by null modem cable between two ST's or two amigas :P
or between an Amiga :P and an ST by null modem cable only.

It's a fairly complex game, but rewarding if you have the patience.

Allen

>MultiTos was developed for was it?

If you had quoted more of Len's article, you could still read that his
idea was a small bay where cartridges could be plugged in. That way one
would have a sort of rom-drive. Fast and reliable and without need for
maintenance.
If equiped with buttons to choose a cartridge this could easily be used
to accomodate some fancy games. Of course the cartridge memory would
have to be LARGE...

Tho thirds, actually, i.e. a 30 MB RLL drive can be formatted to
20 MB with a MFM controller.

> Yeah, I wondered about that. When I boot my Megafile 60, the HDdriver
> looks for some 0 and 1 unit, of which only the 1 is present. Isn't the

No, it's target number 1 that the driver is looking for. Remember
that the ACSI bus offers 8 target numbers, and each target can in
turn control up to 8 devices (LUNs). An upgraded Megafile uses
one target number, but two LUNs. AHDI only checks for LUN 0 for
each target number.

6987. Re: Multi-player games using MIDI or RS-232?

Newsgroup: comp.sys.atari.st
Date: 1993-05-14 09:13:45 UTC
From: nikhan@erix.ericsson.se
Message-ID: <1993May14.091345.27973@eua.ericsson.se>
Source record: 205916

Since several people has been kind enough to answer my plea for
information regarding multi-player games and several wanted replies, I
hereby post the results. It should be interesting for other ST users
since I think that the list is surprisingly long. My problem is that
many of these programs require one meg of memory which my old STM does
not have. Note that I have not tried most of these programs myself so
I guarantee nothing.

MidiMaze I and II (MIDI of course, works wonderfully, very fast. From an
Atari ST User cover disk, I think)
Falcon (the flight simulator, communication between different computers)
F16 Combat Pilot (similar flight simulator)
Hoversprint (race game)
Stunt Car Racer (or Stunt Car Driver, race game)
Cold Revenge (from an Atari ST User cover disk, needs one meg :-( )
Vroom (race game)
Turbo Challenge 2 (race game)
Flight of the Intruder (flight sim)
Hard Drivin' 2 (race game)
Rayoids (ST Format cover disk, asteroids clone, needs one meg for
multi play, MIDI or RS-232)
Populous I and II (strategy games)
Flightsimulator II (old and slow)
Cyberdrome (hoverjet simulator, needs one meg)
OXYD I and II (PD, works in highres/lowres, ST, TT and Falcon)
Armour Geddon (RS-232, communication between different computers)

Maybe more of these programs need one meg of memory. I don't know since
I haven't tried them.
Thanks to everyone helping me compile this list.

By the way, does a list of STE utilizing programs exist, demos
excluded (these I can find myself). By that I mean programs which uses
the STE's extra capabilities and aren't just STE compatible, or is
this a FAQ question? If so, mail a reply.

Send a mail to Martin_Wevelsiep@ac3.maus.de - he offers an RAM expansion
which expands your memory up to 14MB in STs and up to 10MB in STEs - and
that's *real* ST-compatible RAM, with full DMA and screen access
possibilities, so it works with every TOS version and even most old
programs have no problems using it (except when they think 'there can't be
more than 4MB, so I won't use it').
```

Try MIDI-Maze - that's a multi-player (up to 16) 3-D maze game, where you
have to shoot the other players. You can play in teams, and there are lots
of extras. When playing with 5 or more players, it gets real fun!

It's shareware, the unregistered version can only play with the mazes on
the original disk, the registered version contains a maze-editor.

: The only way it could be slower was if it was accessed as ST mem (ie The
: graphics and DMA chips are allowed access to it), but since you NEED tos 2.+
: to have this mem, I would have thought it was installed as TT mem, and so
: faster than normal ST mem (NS) -Please correct us if we're wrong (Naaa..)

According to Jim Allen of Fast Tech fame, any memory connected over
the VME bus is impossible to cache and therefore slower than normal
ST-mem in a MSTE (which has a small cache). I never got around to
ask if the memory was installed as fastmem, but I guess so.

Fast Technologies takes another approach by making a thing called
Turbo RAM, which fits in the BLiTTER-socket and gives you 4 or 8
megs of extra RAM. The board takes one SIMM-module (Mac-model). Jim
also said that his Tiny Turbo can take full advantage of the speed
of the SIMM on the Turbo RAM board. So if you populate the Turbo
RAM board with a 80ns SIMM it will have the data ready in approx
150ns for the Tiny Turbo (directly from Jim's mouth). The Turbo RAM
board is 199USD unpopulated. Add 120USD for a 4 meg SIMM and 240USD
for a 8 meg SIMM.

Note: I'm not affiliated with neither Marpet nor Fast Technologies.
I'm merely looking for a way to expand my MSTE and I thought my
findings could be of interest to some other netters too. :-)

I noticed that some games mentioned in the list were published as
cover disks. I guess if one wanted a copy, one can always try and
write to the publisher asking if that issue is still available,
but are there other ways to obtain copies? What exactly is the
copyright status of software published on cover disks?

>Wake up! For "real" Unix the Falcon is too slow.

This is not correct. Look at SUN3 etc. The computing power of a Falcon
is surely enough for a one-person multitasking machine. X is probably a
bit slooooow. And heavy number crunching is probably also out of the
question. Since I don't know anything of the screen modes I won't
go into that, but it probably is of some influence.

Concerning Linux, there is a bunch of people working on a Amiga/Atari/
Mac/Sun3 port of Linux. But that will probably take a while to become
a stable system.

Hi,

Having received no replies to the original message, I rechecked to find
an error in the headers. Here it is again with apologies who may have
unsuccessfully replied before.

I have been asked this question by a friend who has a MegaST. If you can help,
please reply by email so I may summarize for him (and for anyone else who asks).

The question is simply....

Are there extended handles for the Bcon* calls for using the extra
serial ports found on a MegaST? If so, what are they.

Thanks,
John

Well, this _MIGHT_ work, but it definitely doesn't have to.
The problem is that a Speedo-font might actually have the same ID# as the
bitmap-font. Furthermore there is one Speedo-font that uses the same ID#
as the system font - 1 (I think it was Swiss 721 light or so).

So I don't recommend using both bitmap and vectorfonts.

|> It worked for me - any point in me changing it to the new correction?

You'd better change it. That way you'll be sure it will work in any case.
For example, the old fix wouldn't work if you run the game in mid resolution.
Moreover, I recommend that you run the game in low resolution, or the
powergraph graphic will have just one colour.
One last precision: the sequence marked 'unchanged' won't be executed, so you
can apply the fix from the first (original) or the second (bad fix) sequence.

Message-ID: <1t06ov$4jj@news.cerf.net>
Source record: 205926

To Ofir and anyone else who wants more info about MARCEL:

The address et. al.

Sorry I didn't put the contact address in my last post, but I didn't have any of the information with me. The address to contact for further information on MARCEL is:

MARCEL Software of California
318 Mendocino Ave., Suite 51
Santa Rosa, CA 95401
USA

Or contact them by Internet at: marcel.ca@genie.geis.com
Or on GEnie at: MARCEL.CA

The introductory price is US$39.95 ($49.95 after May 31, 1993). It is compatible with the ST, TT (STe), Falcon and MultiTOS.

More about the program

I had been looking for something I could use at home and then take to the IBuMmer at work. ASCII worked, but, of course, with ASCII you lose formatting such as bold and italics. And there is always the nasty task of going through the document once it's loaded somewhere else to remove all of the hard returns at the ends of lines. When I saw that MARCEL's native file format was Rich Text Format, I decided to give it a try.

I'm glad I did. The test files I made on my Atari Mega ST2 were read perfectly into PageMaker 4.0 at work, printing out with boldfacing, italics, underlining, super- and subscripting intact. (IBM PC, but various Macintosh programs read or import RTF also.) Other tests which worked fine included: reading my ST WordWriter files with everything intact; a printer driver for my Epson 9-pin which finally prints boldface type in Near-Letter-Quality mode (my ST WordWriter did not); a WordPerfect 4.2 file (saved as 4.2 from 5.1) being read fine, with only one stray character at the start of the first page where the WP header info would be.

The program will save as RTF, ASCII 7-bit for E-mail, ASCII 8-bit for enhanced ascii capabilities, and special options for saving are featured. These include changing italics to underlining, for those professors still living in the pre-DTP age :^). And ASCII can be saved with E-mail conventions in place of *italics* and _underlining_ and the like. Very

handy.

A quick list of other nice features (before this message gets way too long--
I have to save some for the review I am doing, eh? :^) : a 45,000 word
spell-checker with British or American spelling list; programmable
function keys for repeated text -- handy for the screenwriter; a notepad
saved but not printed with the document; paragraph formats inherited from
one paragraph to the next; menu/hot keys for selecting words, phrases,
clauses and paragraphs and transposing or otherwise manipulating them;
a template feature; text is reformatted for screen margins after a timed
delay that you set; and more and more and more.

Anyway, Marcel were very helpful and forthcoming in their answers to my
questions prior to my purchase of their program. I'm sure they'll be more
than happy to answer any questions you may have, also.

Hope this helps!

:copyright status of software published on cover disks?
:
:Greetinx, Jan

I have had three programs published in Atari ST Review (UK) and one in Atari ST User (UK).

My written agreement with all of these was that each program:

1) Could not be re-published by another magazine, ever.
2) Could not be distributed by any other means for three months after the magazine's cover date.
3) Had never been published by another magazine.
4) Otherwise remained under my legal control.

I have no reason to suspect others will have been treated differently unless they are specifically marked as such (eg. have a huge copyright notice on the title screen saying "If You Copy This, May Your Armpits Be Infested By The Fleas Of A Thousand Camels" etc.).

Thus if the magazine is three or months old, and DOESN'T say "reproduction only by written agreement with the copyright holder" or somesuch, it may be freely distributed.

Copyright is NOT "distribution rights". Much shareware is copyright, but you can still distribute that. Copyright just sorts out who is the legal owner of the work. If that legal owner specifies that you must not copy it, you must not copy it. If no such specification is made, you can copy it.

(Well, that's the UK position. :-)

No.

Just answering!

--Tom

Seriously, no LAN software comes with the Falcon. A few weeks ago someone
posted that there was no Apple Talk comaptable software either.

You can of course get networking software for it (compatable with the TT).

7001. Re: GEnie.

I just signed up for GEnie a couple of months ago, and I'm pretty satisfied with it. It's the "official" Atari on-line service, meaning you'll probably find more fellow Atari users and
more support for Atari than any other on line service. The rates are $4.95 per month, plus $8 an hour during non-prime time (that's from 6 p.m. PST till some time in the A.M.) During prime hours it's $12 per hour. It's easy to sign up by calling the "800" number (I don't have it off hand). Check the latest issue of the now suspended "AtariUser" magazine (if you can find one), which has easy to follow instructions on how to sign up. If you have no luck finding out how to sign up, leave a post on "Sherwood Forest" BBS and I'll try to get back to you. . . or call Mark van Wyk (408) 739-0541.

Does anyone out there use GEnie? I was reading about it, and saw those $8 an HOUR charges... which seems really ridiculous to me. But then I was reading something else which said that it was $8 a month, and no hourly charge if you don't call during the Prime hours. Nowhere could I find what the Prime hours were though. So basically, what I'm asking is: Does anyone know the EXACT rates, and if it's really worth it? Do they have a file x-fer area, or is it all messages? What? I have no idea what the place is all about, as I've never called.

> is renamed "Word Processor", and "MS-DOS" is renamed "OS". Spokespeople
> from both companies have stated that the name changes are to avoid
> confusion in the marketplace, since the new names are the more common
> terms.

Oxford have announced the latest addition of there dictionary will contain the
following changes:-

"Computer" now means 'a device incapable of accessing any RAM above 1meg,
although it shall come with 8meg'.

"Graphics" now means 'A standard visual system that becomes increasingly
unstandard propotionally with the increase in quality'.

"Software" now means 'A useless collection of bytes that is sold at ridiculous
prices to an illinformed public'.

"Word Processor" now means 'Crap'.

"OS" now means 'A brain dead program which can only access 640K out of the
imeg accessible by a "Computer"'.

A spokesperson said that the definition changes were to cause confusion in the
marketplace, since the new definitions were different to those supplied by two
main companies.

Intel and Microsoft are said to be sueing, but they haven't decided who yet.

>Erlend.

There is software/hardware to do a ROM-Drive out of the cartridges, allthough
the biggest size a cartridge can be is 128KB.

It shouldn't be very hard to make a cartridge with bigger memory than 128KB by
mapping the ROM and using a software driver for it.

The trouble is that a cartridge with a couple of megs of software is
10-30 times more expensive than diskbased software.

Hmmm... Insectroid is more of a 'galaga' copy what with the challenging
stages n'all. Its pretty good. 'SINISTER Software' have a very good copy
of the original, straight forward, 'galaxians'. They also made the
excellent 'centipede' copy thats on a.a right now so I expect to see
'galaxians' copy on there soon. I might post it to comp.sys.atari.binaries
if I get some time.

Oh, C'mon... the piracy situation is bad, but not THAT bad.

You, as a developer, would make a good profit if there were enough
Atari computers on the market. The pirates don't help any, but Atari
doesn't help any by only producing 10,000 or so computers a month.

I didn't call you _stupid_... I just said that most developers are gone.

Hey, lack of competition should create mor sales, no? :)

>

Read the above. The difference is we don't even need new hardware, or even software, to read PC disks. In fact, ST's don't even need a new drive to read Mac disks, we use the standard w/ "Good ol'" Spectre GCR.

Now, don't flame me about the fact that Amigas can too. Only if you have the
A-MAX II Plus which I haven't even seen in existance yet. The straight A-Max
can't do it.

> Almost anybody ...
>

Everybody has s+VGA. The only thing is, if you want to talk game software,
just _now_ we're getting software that uses 640x480 in *static* pictures. Most
use 320x240x256 colors. Strange that w/ Spectrum 512 kind of technology, an ST
can pull that off. (WC-II on the ST in full VGA colors. Hmmmmm.....)

> And, in opposition to ATARI computers, all these colors on AMIGA have

>
> Perhaps not on ATARI, but on ALL other platforms you need only some peanuts
> to get thems ... ;-)
>

32,000 colors standard on the Falcon030. 4096 _standard_ on the STe.
With the CyReL card, 16.7 million colors, resolutions up to 2048x2048, on
monitors up to 37".

> I did not think that computers will be very less expensive without it.
> The difference isn't so big to not get these colors ...

>
> I have an Amiga since 1986, and i have choose it considering also ATARI.

> But it was definitely CLEAR to me that ATARI ST offers ALWAYS less than
> Amiga computers, on Hardware AND on OS.
>

Name a recording studeo w/o an Atari. Case in point: American Music. At the University of Washington Computer Fair, they had a 486 and some Mac there (They're all the same, what's it matter...) They had software lists and all for both machines. I asked the salesman what I should do for MIDI sequencing, i.e. what hardware I needed. I told him I had an ST and he told me not to get any hardware, just software. When I told him it was 6+ years old, he said get some RAM and then the software.

If you don't think that's significant, upon going to their store, I didn't see one PC, and the only Mac I saw was sitting in the corner w/o a monitor. There were ST's everywhere, [1 520ST, 1 1040STfm, 1 Mega 2 ST, 1 Mega 2 STe, 1 TT030] All running.

Curious. That _seems_ like professional applications....

>
> -> Buying a TT or Falcon is another matter.
>
> TT have technologies of yesterday ... not interesting at all !!
>
> (YARK !!! What a PIZZA BOX !!!!!)
>

Have you looked _inside_ a 4000? The expansion slots are a joke. There are three of them. And three PC/AT slots. Bridgeboard? I think not, not with that little room.

> Falcon, can you buy one PRESENTLY ???
>

Yes. I'll sell you one. Want one?

> Falcon is technology of tomorrow for after-tomorrow ... with promises to
> be relaesed yesterday!!!
>

"Technology of Tomorrow"? I like it. Thanks.

> The important thing is to be satisfied with youe computer, same as you said!
>
> But, try seriously an Amiga 1200, and i sincerely think that you will never
> want your ATARI again.
>

I do, every day. I do like them, I just don't like the way so many people put down STs. I will not blatantly flame Amigas (it's bad for business), but I will do my best to set _people_ straight.

Sorry for the length. And _really_ sorry it's in here, but these kind of things get to me. If you want to flame me, do it in c.s.a.a., and I'll

probably ignore you.

>

Yes and no. ;) You'll have to get rid of the Host Adapter and hook it up with a straight SCSI cable. If you're using ICD's Link, then all you have to do is plug in the Link-less cable into the Falcon (After using a SCSI-I SCSI-II converter.) If you are using an internal host adapter, then you'll have to get a new converter. I'd suggest getting just a new box with the internal/external SCSI converter. What you might want to do is get one with a SCSI-II output and enough room inside to add many things. Like a SCSI-II Poineer Quad Speed CD-ROM drive (they exist!), or a _really_ fast SCSI-II hard drive.

> 2) Anyone heard the latest on the 486 emulator? Is it done yet? Is it
> any good if so?
>

It's in [final?] beta. It looks really nice from what I've seen/heard. It uses the Falcon hardware a SVGA color. I believe the software is almost being completely rewritten since someone suggested a few things. 1) Using the Falcon as either Pro Audio 16 or SB16 and tricking the software with some IRQ/DMA wonderwork. 2) Running the 486 as a parallel processor with the 030. It's possible with the hardware setup, and Atari _is_ the company that developed the TransPuter.

> 3) Anyone know when the hell the Falcons are gonna be available in the
> US??

You can get them now. I'd wait about four to six week first, though. If you have any problems getting them, mail me and I'll see what I can do.

Hope I could help.

Sorry to respond in comp.sys.atari.st (the advocacy group isn't at
my site yet). Anyways, a rare respose of mine to a flame - hit that
'n' key now to avoid it :-)

In article <huots00.737362021@tohi> huots00@tohi (SYLVAIN HUOT) writes:

>YARK!! Atari world is so closed that nobody needs to exchange with
>other platforms ??

Yark???

I dunno, I exchange graphics, sound, word processing files, etc
between my MSTE and 386 (and MAC)...

>When i am doing FTP, i ALWAYS copy files directly form the Sun's floppy to
>a MS-DOS Disk, and i read them directly with my Amiga ...

Funny, that's exactly what I do with *my* Atari. Who knew? :-)

>I think that all people that needs to do many normal things with their computer
>*AVOID* to buy a ATARI ST/STE/TT/FALCONVAPORHARDWARE 'cause they know that
>computers can't ...

Doesn't sound like you've ever *used* an Atari, muchless know what it
can/cannot do. *All* stock ST's can read and write IBM format disks with
no problem (720k). Newer machines (Falcon, TT, and my MSTE) can read and
write 1.44meg IBM disks as well (my MSTE is stock, BTW).

re: "to do many normal things with their computer" - I shan't ask what the
alternative is... :-)

>... other that buy ATARI don't care what others do, they don't know frequently
>what AMIGA/MAC/PC do !!!

I have a PC (286) as well as a MAC emulator, and a friend of mine has
an Amiga - have seen what they can do...

>And, in opposition to ATARI computers, all these colors on AMIGA have
>professionnal applications and using. I think you know well DESKTOP VIDEO
>and MULTIMEDIA.

I never knew there were "professional" colors and "amateur(?)" colors.
How do you tell the difference?

>When you try an Amiga ... you didn't want to exchange it with a PC, a MAC
>or a ST! ;-)

I've tried Amigas. I wasn't overly impressed (nor disappointed)...

>Falcon is technology of tomorrow for after-tomorrow ... with promises to
>be relaesed yesterday!!!

...why do I have the sudden urge to watch an Abbott and Costello
routine :-)

>The important thing is to be satisfied with youe computer, same as you said!

Yep, Amiga, Atari, or whatever. Doesn't matter if someone else doesn't
like it ;-)

>But, try seriously an Amiga 1200, and i sincerely think that you will never
>want your ATARI again.

One of my friends has a A2000. I've stayed with the Atari however...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...to those non-Atarians: I don't intend this as a flame (I've said
nothing bad about non-Atari systems above, as you can read) - I just felt
the message being replied to was misinformed enough to point a couple
things out (including a rather one-sided view of the world of computers) -
the sarcasm is in response to that, and not to the computers being talked
about... (so don't yell at me Raist :-)

Without a doubt, GEnie is the best online service deal for U.S. based Atarians. I say U.S. because I don't know about GEnie fees in other countries which may or may not be prohibitively expensive compared to other online services.

For a flat $4.95 per month you get access to the GEnie Star Services, which includes unlimited mail privileges and a host of other goodies in the non-prime time hours. It's $8.00 per hour non-prime time for accessing area like the computer roundtable forums. If that sounds expensive, check into what Compuserve charges! Plus, you can get a free telecommunications utility called Aladdin which is designed to automate (and greatly speed up) your time spent on GEnie. 300, 1200 & 2400 baud is the same price.

PC and Mac users I'd recommend Compuserve, but for Atari users, GEnie is the best deal by far, IMHO (especially considering it's the official online network of Atari Corp and all major Atari devs frequent and support it).

In all fairness, Delphi represents a _heck_ of a good value as well, but there is not as much Atari action there as compared to GEnie.

For info about GEnie, U.S. users call voice 800-638-9636. To sign up by modem, set it up for half duplex (local echo), dial 800-638-8369, hit HHH upon connection and at the U#= prompt, enter XTX99437,GENIE and hit Return. You can then sign up if you have a major credit card or take a short tour.

I'm not affiliated with GEnie, just a happy users for several years now.

>the place is all about, as I've never called.

I use GEnie, but to be honest I couldn't give you a list of rates.
I do know that it's cheaper to call after 6pm than before 6 (before 6
being called "prime time" I think).

Also, there are BASIC areas and CHARGE areas. I *think* you can
use any of the BASIC areas (EMAIL, etc) for minimal charge ($5 comes
to mind, but I cannot recall if its by hour or month).
Using a CHARGE area (like ATARI) however, has an added charge to it.

Since I would assume that most internetters would probably hang
around the COMPUTER-specific areas, the higher charge would probably
apply (but no one would call before 6pm, would they? :-)

Oh, there are basically 3 pieces to the GEnie layout (at least in
the computer-specific area): MESSAGE BASES, ROUND TABLE (REALTIME)
CONFERENCES, and FILE AREAS. I don't read the message areas too much,
so I can't comment on those. However, the RTC (conferences) usually
involve some company (Atari, Purple Mount Comp, etc) where information
can be talked about, and questions asked (and answered). Bob Brodie,
for instance, holds a monthly RTC. Most Wednesdays its usually
just non-specific conferences. As for the file areas, they have
a *lot* of files there (my two sources for files are atari.archive
and GEnie) - some files may be on GEnie, and not on atari.archive,
and vice versa...

It's not the most elegant interface to work with (reminds me a little
of VMS), but using a front-end like "Aladdin" lets you work with it
via GEM-specific controls (just like a normal Atari program)...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

>found only a picture of Bob Brodie :). Is there some FTP site with
>many many .PI3's? Thanks in advance!

Here's an easy way: get a copy of VIEW GIF 1.2 (should be at atari.archive.umich.edu), get a bunch of GIF pictures, and then convert the GIFs over to PI3 using the Viewgif program (you must be in mono mode to do so; if you're in color mode, I think it'll let you make PI1 and PI2's)...

Hope this helps...

7017. ICD utils and TOS 3.06

Newsgroup: comp.sys.atari.st
Date: 1993-05-14 20:06:29 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1t0u45INNs3c@news.u.washington.edu>
Source record: 205941

I just got one of the newer TTs with TOS 3.06 and I installed ICD Link utilities on partition C. When the computer boots, it doesn't seem to always recognize the hard drive. After the Atari symbol comes up, the HD light flashes a couple of times, and then it just hangs there. It does this cold OR warm boot. It seems to be random when it will "hang" like this and when it will boot correctly. I have a MAXTOR 213MB hard drive. I tried reformatting the drive with ICD Format, but it still has the same problem.

If no one can solve this problem for me, at least someone can give me the Email address of ICD, if they have one, or someone that would know what's going on. Thanks!

> mounting?

I'm pretty sure no one's ever written software to use the LocalTalk port
in the MegaSTe, TT, or Falcon. The authors of PowerNet and PowerDOS
were working on something, but I'm not sure when it will be ready.

The Atari OS also makes it difficult to do something useful, like print
over the network. You'd need a special driver for your network
printer... that's not likely to ever exist, since the "amazing" and
"complete" new SpeedoGDOS doesn't even have a PostScript driver...

Source record: 205947

Craig Graham (Craig.Graham@newcastle.ac.uk) wrote:

: Has anyone seen the Legends Of Valour demo on the cover of ST Format this month?
: Is it any good ?

: Craig.

I saw the demo tried it out at my local store. Seems to work ok. I didn't play with it long enough to decide if it was any good in game play. I did notice that many of the thinks that were complained about on the PC didn't seem to occur. For example, Doors opened with a bang instead of having you walk through the door. All windows can be looked out and in. I didn't get sick. There didn't seem to be any police hassling me. The virtual reality was quite unique but I don't know how much it adds to the game. The general quality of the graphics (ie the icons, buttons, and places you see) were average at best.

All in all, I think that it's well worth the price if you are thinking of buying the game and want to test it out. The docs on use or the demo are real poor. I think that only the game save is disabled. Other than that I think it's fully functional. One sad note was that it didn't run on a Falcon...

John

I don't know about IBM and the US, but at NCR in Canada, I was able to
cross out parts of my contract that I didn't agree with. Specifically,
there was a clause that would've prevented me from working at my
profession for two years after stopping work for NCR. Personell had no
problem with that being stroked out.

You should discuss it with them though! It's not like anything to do
with the Atari platform could ever affect any of IBM's markets or
products...

I think the only harmful aspect of that article was the fact that its
tone blamed the entire Atari market mess on pirates, instead of planting
it firmly on the shoulders of Atari, where it belongs.

I don't really think this is an "average" ST/TT/Falcon user; this is the
fate of those people living NO WHERE NEAR an Atari dealer, or even a
store willing to carry Atari software. Again, no one's fault be Atari's.

There's no such beast. In fact, there's no PD/SW converters for font
editors that I've ever heard of. ATM (joy!) and TrueType (ick!) are the
place to be for free/PD fonts galore.

My reason for living... ;-)

Computers generating images; ray-tracing (wahoo, POV-Ray!), fractals,
animation, goodies like that.

Generally, stuff that looks real nice, and takes grotesque amounts of
CPU time! :)

Thanks for the info. I do have to admit however, I think you lost me on most of the solution for being able to hook up the MegaFile to the Falcon... guess I'll just have my dad ask some of the tech types at his work to tell me exactly what to do, and give me the neccesary hardware to do so. As for me being able to get one, that's no problem, as my father works for Atari... I'm just wondering when they'll be available here so I can actually get a look at one..and hopefully even some people will start buying them. Hell, maybe there will even actually be some LCOAL Atari boards again!

>It's $8.00 per hour non-prime time for accessing area
>like the computer roundtable forums. If that sounds expensive, check into
>what Compuserve charges!

Indeed... check into what CompuServe charges...

It's $8.95 per hour... with NO RESTRICTIONS on time of day..

Call any time.. day or night... one price...

Check into what GEnie charges for daytime access!

>It's possible with the hardware setup, and Atari _is_ the company that
>developed the TransPuter.

Er.. no...

Atari is the company that hemmmmed and hawwed, and waffled and
finally dropped the ATW (Atari Transputer Workstation) after
selling a few here and there in the world.

The transputer chip was designed by Inmos, a real computer
product company. Their chips are used in REAL transputer
workstations, still available and still used by serious
power computer users.

(And in fact, the ATW was developed by someone else... Atari only
played at marketing it...)

> Also, for anyone familiar with KA9Q, what address should I use when
>FTPing to another site?

KA9Q for the ST doesn't understand "name paths", so you need to
obtain the Internet Address for the sites you want to FTP to.

For example, the IP address of the atari.archives at the
University of Michigan is:

141.211.165.41

It's a little like collecting BBS phone numbers.. you have to
watch for interesting IP addresses, and add them to your KA9Q
Hosts.Net file.

The KA9Q archive on CompuServe includes a very good set of text
files written by Bill Rayl of the Atari Interface magazine, which
make it easy to get KA9Q up and running...

Info time....

] > I know MultiTOS is much better than Unix :-) but will there be a unix

The smiley face usually means someone is joking Ted!

7037. ESS GEM UUEncode & UUDecode POSTED - c.b.a.st./atari.archive

Newsgroup: comp.sys.atari.st
Date: 1993-05-15 09:48:58 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.sQG1LFxWy7Q@elfhaven.ersys.edmonton.ab.ca>
Source record: 205844

Hi!

I think that there are some users (at least I hope there are) who will be interested in these public domain programs, which is why I am posting this article.

Using the available source code for UUEncode and UUDecode, I have written GEM implementations of both of these programs. Why? I hate the old, slow, inferior versions available (although there are a few that are good). They have been posted to atari.archive and comp.binaries.atari.st (and should be available soon). The filename should be ess_uux.zoo (or ESS_UUX.ZOO).

Please note that these programs are not MultiTOS compatible. They should work on any Atari (including the Falcon) in any resolution that offers at least eighty columns. No MultiTOS, though, sorry.

Here is a -short- excerpt from the documentation which explains some things:

Why should you use this version instead of one of the other ten or twenty currently available?

Here are three good reasons:

a) SPEED - ESS UUEncode & ESS UUDecode are much faster than other versions of these programs that I have tested. In some cases, the difference is as much as 350%!

b) APPEARENCE - ESS UUEncode & ESS UUDecode use GEM! This means that you are given a nicely formatted progress display (which shows the output file, the input file, the currently active parameters, the source and destination path, and a growing thermometer bar that indicates how much of the current file has been processed).

c) COMPATABILITY - While UUEncode & UUDecode have remained roughly the same, the Atari ST has not. ESS UUEncode & ESS UUDecode have support for the ARGV command line standard that Atari has put forward. They also have support for the Mark Williams C xArg command line standard, and the default command line standard used by older ST systems.

Comments are welcome, as usual. Please be gentle with flames, though.

Is there any place on the net where I can get help on running KA9Q?
It could be that I just dont know what I am doing, but I am having a
hard time get any results...

Thanx

I am looking for a 286 or 386 PC emulator for my Mega STE. If anyone in the
UK has one they don't use or has an opinion on the best/most reliable one
to get, mail me or follow up.

John

PS I need it mainly to develop some database applications with Foxbase Plus.

Hallo Everybody,

At the Dortmund HOBBYTRONIC Fair I bought the above Harddisk.

Despite trying out various junper positions, the d... thing did not run properly. The LED showed that there was some connection, but the computer did not recognize the HD. When I tried to communicate with "C"-partition, the window that opened said "ROM-MODULE".

1) Who has experience with the above HD?
2) Who has any suggestions?

I have an ATARI 520ST+ and so far have 2 Seagate HDs running without any problems. (ST 4096 and ST 251) I just wanted to substitute the new ST 4097 for the ST 251.

regards

I use GEnie and I think it's worth it. It's $4.95 per month for the basic services (e-mail and some roundtables), and the computing areas (Atari, etc.) are $6.00 an hour.

If you do sign up, definitely get Aladdin, which is a free download. It helps you get around.

Universal Network has been around for a few years, and PowerNet and
PowerDOS have been around for at least a year. Universal Network is
no longer being updated because its author is the author of PowerNet
and PowerDOS.

PowerNet and PowerDOS were marketed by Dragonware Software, but now they're
marketed by Viewtouch which is I think in Oregon. They sell TTs with
touchscreens for point-of-sale displays.

Both Universal Network and PowerNet support the LAN port and MIDI ports.

> at NCR, I crossed out portions of my employment contract I didn't agree with

Boy, that was nice of them. In my last 9-5 type job, some years ago, AMS found out through the grapevine that I had an article published in Antic magazine while I was working there. The Big Boss called me on the carpet and pointed out that my contract said I couldn't publish anything, and I must never do it again. (They were concerned that proprietary things developed on their time might become the subejct of published books/articles.) I pointed out that it was an Atari-specific magazine, and I could hardly be publishing IBM-mainframe-specific company-related work in it, so obviously an exception was in order. He said there were no exceptions for any reason. So I quit, right there on the spot. (I was really lucky that I had just found out I had gotten a contract working for Jim Kent/Autodesk the prior day. I had been planning on quitting anyway, but it was fun letting him believe it was because he was such an ass.)

7049. Re: KA9Q

Newsgroup: comp.sys.atari.st
Date: 1993-05-16 03:31:19 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <81464@cup.portal.com>
Source record: 205825

Basically, to get KA9Q runnning, you need to put the HOSTS.NET file in the ROOT directory of whatever drive you run KA9Q from.

That file contains the IP addresses of the systems you want to TELNET or FTP to, and a mnemonic name for each of them.

It's just a standard ASCII text file, so it can be edited to add more IP addresses as you collect them.

Then the NET.RC file goes into the same directory with the KA9Q files, and must be edited to reflect your local telephone number for net access, at the baud rate you want to use.

The other entries that need to be edited are the HOSTNAME and LOG lines.

An example for adding an entry to the HOSTS.NET file would be to add a line to the end that reads like this:

131.216.1.11 guitar

(That's the IP address of ftp.nevada.edu where there's an archive of music lyrics and guitar tablatures for playing music)

Then you'd run KA9Q, and after the modem dials and connects, and you eventually get a net> prompt, you'd just enter

ftp guitar

and KA9Q will attempt to make a connection to ftp.nevada.edu.

At that point you just make an anonymous FTP connection, just coming from a mainframe.

Billy D'Augustine wrote of having problems...

What exactly is happening when you try to run KA9Q...?

***** PAGESTREAM LACK OF SALES *****

Well one user here had given up on Pagestream, he still has 1.8 and is fed up
with the BUGS...

BUGS not being, fixed does not help sales at all..

I have found that version 2.2 is still full of BUGS, its the only
DTP Program that W.S.I.N.W.G, what you see is not what you get,
its can't print the Compuphic fonts in large point sizes, also I made
a elongated box with some 64 point text in it, the lower part on the box
is missing, also all the larger Times fonts don't print, it also raped part of
a word to the other edge of the paper..

I was using a HP deskjet..

No wonder they can't sell Pagestream with all these bugs, no one wants
unrealiable software, the trouble is that Pagestream has got that Tag now,
and is hard to shake off..

Its good job that I have not brought it, I was going to, but after playing
with my friends registerd copy, if I had, I would be suing the firm as it
does not do what its claimed to do..!!!

To many software firms get you to pay for Bug fixes in there upgrades..

Can any one recommend a good DTP program thats good for Flyers with scaleable
fonts, not Calamus thanks or Outline, you need a degree to run those, but
still one along the simple lines as Pagestream..
NOTE: must be in English...

Thanks.............

Roger.................. sheppard_r@kosmos.wcc.govt.nz

Can't tell you where to get it, but the most recent copy of the ST Club's ST Applications magazine has a preview of Comdex 92 by Mario Gardenghi which states:

"International TOS Software Catalog : a 500-page catalogue reviewing almost all software available for the ST/E, TT and Falcon. The reviews are small but well done with screenshots. The price is very low: $12"

Going by the price and the spelling of "Catalog" in the title, it must be from the US.

7053. Brainstorm DSP developments

Newsgroup: comp.sys.atari.st
Date: 1993-05-16 08:22:19 UTC
From: 73110.713@CompuServe.COM
Message-ID: <930516081816_73110.713_FHG35-1@CompuServe.COM>
Source record: 205828
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This information about Brainstorm's DSP developments for the
Atari Falcon comes from a recent FAQ file in comp.graphics and
it reports that they are steadily improving their MPEG decoder.

Since they are getting over 10 frames per sec in the 320x200
16-bit color mode, I would guess that the Falcon is capable
of decoding at 30 frames/sec in a 16-bit color quarter-screen
window *with* high-quality stereo sound? Maybe we should all
chip in $20 to help Brainstorm out with their DSP software
developments....agreed?

III.7 | ATARI

From 72241.405@compuserve.com Tue Apr 13 17:56:15 1993
Date: 13 Apr 93 10:40:34 EDT
From: Brainstorm <72241.405@compuserve.com>

Bonjour!,

For technical points about our MPEG decoder: It's a SOFTWARE ONLY decoder,
currently running on any ATARI FALCON computers (not on the TT, because
it uses the MOTOROLA DSP56001).

Video output modes:

- B/W, using a 4x4 bayer dithering matrix.
- 4 greyscales, using a 4x4 bayer dithering matrix.
- 16 greyscales, using a 2x2 bayer dithering matrix.
- ATARI 15 bits true color (no dithering).
We have to write the 256 colors and the 24 bits true color modes.

Decoder's MPEG compatibility:

It currently only handles I Frames. We have found some MPEG files with P
and B frames, so it shouldn't a problem to implement P and B decompression.
We don't handle MPEG sound, because it's currently impossible to find MPEG
fileswith MPEG sound. The only card which seems to encode MPEG sound is
from Optibase, and I ask them to give us a MPEG file with sound, but there
were not very 'interested' in helping us...

Decoder speed:

It depends a lot of the MPEG file and display mode. Here are some benchmark
with 4 known MPEG files:

File Size (Bytes) Time (Frames/Sec) Video Mode

F16.MPG 94959 12.15 320x200, 4 Col. (TV)
F16.MPG 11.25 320x200, 16 Col. (TV)
F16.MPG 9.10 320x200, T.C. (TV)

MJACKSON.MPG 724567 13.82 320x200, 4 Col. (TV)
MJACKSON.MPG 13.19 320x200, 16 Col. (TV)
MJACKSON.MPG 10.40 320x200, T.C. (TV)

ROM.MPG 250937 9.25 320x200, 4 Col. (TV)
ROM.MPG 8.81 320x200, 16 Col. (TV)
ROM.MPG 8.02 320x200, T.C. (TV)

TAHITI.MPG 303547 11.87 320x200, 4 Col. (TV)
TAHITI.MPG 11.28 320x200, 16 Col. (TV)
TAHITI.MPG 9.45 320x200, T.C. (TV)

Decoder Size:

Currently, it's about 22Kb. P and B frames management shouldn't take more
than 10Kb.

Next Changes:

1: Speed: We expect to be 2 Frames/Sec faster in true color mode, and
1 Frame/Sec faster in other modes.

2: P and B frames compatibility.

Decoder's Availability:

Brainstorm is a small company, dedicated in writing software. We don't
want to sell the MPEG decoder by ourself. That's why we are currently
looking for a company interested in buying and distributing it. So, I
can't tell you when it will be available, and what will be it's price.

Brainstorm:
19 bis, rue de Cotte
75012 Paris FRANCE
tel +(331) 44670809
fax +(331) 44670811

We can be reached at:
- 72241.405@COMPUSERVE.COM
or, maybe,
- laurent.chemla@f200.n320.z2.fidonet ??? (we didn't test it)

Date: 29 Apr 93 10:50:06 EDT
From: Brainstorm <72241.405@compuserve.com>

Brainstorm MPEG changes:

Things are moving a lot! Last days, we have been working on speed
improvements on our MPEG decoder. Here are the new benchmarks:

File Size (Bytes) Av. Time (Frames/Sec) Video Mode

BIRDISBA.MPG 502473 15.24 320x200, 4 Col. (TV)
BIRDISBA.MPG 14.75 320x200, 16 Col. (TV)
BIRDISBA.MPG 11.51 320x200, T.C. (TV)

[stuff deleted]

The decoder is now 32 Kb.

As you can see, the speed depends a lot of the screen resolution. There are two main reasons:

1 - The Falcon video chip is connected to the MC68030 bus. It means that the video ram can be everywhere on the falcon RAM (on a PC, the video ram is on the video card). So, if you are using your computer on a nice video mode (i.e. true color), a lot of bus bandwidth is used by the video chip, and the 68030 is slower.

2 - In true color mode, the MPEG movie is displayed in color, and we perform 6 8x8 DCTs, and the colorspace conversion. In greyscale mode, we only perform 4 8x8 DCTs, and there is no colorspace conversion (we use the Y channel).

One of our biggest problem in this decoder is that the Falcon is a '2 chips' computer: the MC68030 at 16 MHz, and the DSP56001 at 32 MHz. We are using both chips (the MC68030 for the Huffman decoder, the DSP56001 for everything else). The speed of the decoder is the speed of the slowest chip. Till last week, the slowest was the MC68030, but we have improved a lot the Huffman decoder. So, the bottleneck is now the DSP56001. Our next big job is the DSP code improvement.

Best regards, Raphael (Brainstorm)

7054. Falcon demos

Lexicor is taking orders for these graphics cards at the end of
this month. It looks like a lot of Atari owners will be able
to rejuvenate their systems with the Nova! (Anyone in Europe
have experience with the it?)

<==>
LEXICOR SOFTWARE PRESENTS:

The NOVA Graphics Card.
<====================================>
Hi

It's me again Yat Siu from Lexicor Software Europe. I have a happy
announcement to make!

Lexicor Software is glad to announce that they have acquired distribution
rights to the NOVA Card. The Nova Card comes in essentially 5 different
versions. Lexicor Software Products that run on the NOVA Card are:

XENOMORPH-3D/PHOENIX (works 100%) all functions

Cyber Colour (works 100%) all functions

Prism Paint (works 100%) v.1.1, 1.5 and the soon to be released 2.0

CHRONOS-3D Newest Version (works 100%) You can even RENDER in any rez at 8bit

GENESIS (works 100%)

Render 24 (works 100%)

Utility Disk (?) I haven't checked all the utilities but nearly ALL
appear to work.

And since it has an own VDI Driver, most Atari Applications that are
written cleanly should work just fine. Now to the availability and the
prices, Lexicor users get a special price as I understand and for those
who buy our Software bundled, they too will get a special price. I have
listed them into Lexicor and Non Lexicor and listed the price respectively
below. I hope the formatting works now! :)

Type of NOVA Card Prices:LEXICOR User Prices:NON-LEXICOR
Description of CARD:

NOVA Mega 32K 300 U$D 360 U$D

32,768 Colors for
any Mega ST BUS

Nova Mega 16M 400 U$D 490 U$D

16,7 Million Colors
for your Mega ST BUS

Nova VME 32K 429 U$D 560 U$D

32,768 Colors for any
Mega STE or TT VME

Nova VME 16M 529 U$D 699 U$D

16,7 Million Colors for
any Mega STE or TT VME

Super NOVA 999 U$D 1199 U$D

Excellence and brilliance!
Requires a VME Bus Mega STE or TT

If you own an ST or a regular STE (eg.1040, 520) then with a special adaptor you can connect the Mega BUS versions on your ST, STE. Price of the adaptor however is to date not known.

Transport is not included, add another 30-40 dollars depending on how quick you wish to have a delivery.

Prices are Subject to possible change but unlikely.

To the specs of the Card now:
All the NOVA Cards, 16M, 32k VME or Mega BUS have this in common:

1.Max Pixeltakt: 90 Mhz

2.Video RAM 1 Megabyte

3.Ramtype DRAM

4.Have Virtual Resolutions

5.Automatic Rez Switch

6.Upgrade Possibility

7.VDI for its Colors (16M have 24bit VDI, 32k have 32K VDI)

8.All have a Videomode Generator

9.All go upto 1024*768 in 72Hz in 2/16/256 Colors

The Max rez in 16,7 Million colors for the 16M VME is 640*480 and the MegaBUS is 640*400.

The Max rez for BUS version is 1024*768 and for VME version is 1088*832 at 70 Hz.

The Max rez at 32k colors for BUS version is 768*512 and VME version is 800*600.

The SUPERNOVA is a dream Card for a dream Price!!!

Max Mhz is 135 MHZ with 16,7 Million colors at 800*600, 32k colors at 1024* 768, Absolute Max at 256 Colors max is 1280 * 1024. Ram type is VRAM unlike the NOVA standard DRAM and has 2 Megabytes of VRAM. It has everything that regular NOVA's have AND has a hardware speedup, making it even quicker!

Naturally, Virtual Resolutions possible!

This is a very, very fine card and is to my knowledge the cheapest available Graphics Card for your Atari. The Crazy Dots which we so promoted before is still a fine card, but proved to be less compatible than the NOVA making for Lexicor Software the NOVA Card be the preferred choice.

Please, as this is a service of Lexicor Europe which needs to import and may run out of stock, consider a maximum delivery time of 6 weeks, depending on your preferred choice of delivery (Ground, Air, UPS or FEDEX?!).

We will have stock, and it should not take so long....I am only being careful! :)

Yat Siu

From: Lee Seiler

Just a few additional comments,

In addition: as a special gift to all our Lexicor software customers Lexicor will be offering a "NOVA-Chronos Private-Stock" bundle which will include all updates for all Lexicor products which run on the NOVA. With the NOVA you can do complete animations from start to finish. This offer will extend to the Phoenix with a special NOVA Phoenix/.ANM update when it is ready.

This offer means that for as little as $529 (plus shipping etc.) you can upgrade your ST/TT system and begin creating full 24 bit animations. It is a plug and play combination you can't beat at any price any were else.

If you want to ensure full compatability of you existing or new Phase-4 software be sure to check here before making a decision on purchasing a graphics card.

Hmmm... I just got a ICD drive myself for my TOS 3.06 TT, and so far it's
running fine.... Boots OK. No problem Warm booting either.

Did you use the ICD HDUTIL.PRG to set the drive to boot?

Other then that, I've no idea.

ICD is on GEnie, which can be reached via InterNet (ICDINC@genie.com)

Tech support is at 1-815-968-2228 (voice),

For Sale:

Atari SC1224 color monitor. This is the JVC model, which has a much
better picture than newer units. It's in perfect condition, physically
and functionally. Includes all cables and original box. I don't
need it anymore since I changed platforms.

Asking $125 or make offer. Shipping not included.

7060. Help for a Uniterm user

Newsgroup: comp.sys.atari.st
Date: 1993-05-16 14:23:19 UTC
From: ggreenbe@rodan.acs.syr.EDU
Message-ID: <1993May16.102319.25145@newstand.syr.edu>
Source record: 205838

I have been using Uniterm for several years now. I have not had any problems and have enjoyed it very much. Very recently (i.e. yesterday) my university switch the way the mainframes work with dialups. The mainframes (Internet on UNIX via SUN and Bitnet via an IBM) used to be configured for 7 bits even parity. Users were told to now configure their setups for 7 bits "space" parity...or 8 bits no parity, especially for users who want to use x modem.

Well, Uniterm doesn't seem to have a way to specify "space" parity, so I have to (and am at least able to) use the 8bit method...But what to do about Kermit now? It seems that I'm forced to use Kermit (on the Internet system, at least)...I'll have to ask about that to be sure. But if that is so, how can I get Uniterm to work? That is, can I get Kermit to work using 8bits? Or can I get Uniterm to work with 7bit space parity?

Any help will be GREATLY appreciated.

Well, nothing much happens. Ive got the hosts.net (?) file in the root, as you say, and the net.rc where net.tos (net.prg?) is, and net.rc is edited to define my hostname and ip address, etc. When I fire up net, it just sits there at the net> prompt, never dials the modem, and generall wont let me do anything...

Yup, but no shops are sellig it, at least not here in Europe. Biodata
developed a cheap (?) Local Talk network, but they scrapped it since they
could not afford to support it. IMHO, this is ATARI's table, they should
bundle something along with the machines.

>editors that I've ever heard of. ATM (joy!) and TrueType (ick!) are the
>place to be for free/PD fonts galore.

Yup. Even commercially, you can get really cheap fonts. B&P has just lowered their price for the Serials II CD-ROM font collection from US$3,000.- to just US$400.-. This disc holds 1000 fonts in 4 formats (Type 1 MAC/PC and TrueType MAC/PC). At 40 cents each this is a steal for the home/office user. For those of you looking for a good vector drawing program, consider DA's Vector, soon to be available in the US. This program uses a propretary font format, a .DFN (Didot) font. It comes with a Type1 to Didot converter though... Future versions of Chagall will have vector capabilities as well and will support both Speedo, Calamus and Type 1 fonts... DA's Vector is not fully MTOS compatible yet, but I hope they will fix it in the near future.

I have just contacted Bitstream asking if their recently released Type1 Star Trek Font packs for the Mac will be available in Speedo format. Avaiting a fax soon (I hope...)

7068. GNU textutils v1.5 bug

Newsgroup: comp.sys.atari.st
Date: 1993-05-16 23:32:02 UTC
From: m91der@tdb.uu.se
Message-ID: <1993May16.233202.17043@tdb.uu.se>
Source record: 205848

The version of the GNU textutils v1.5 which I recently uploaded to a couple of FTP-sites contains at least one program that doesn't work properly (sort, it does its thing, but instead of exiting gracefully it produces an illegal instruction error).

Stupid little me hadn't checked all programs before I posted them (I actually found the bug while porting GNU find v3.8 :-), and what's even worse is that I stripped of the symbol-table on the binaries which makes increasing the stack-size impossible (and setting the stack-size to a couple of kb does cure the "bug").

I'll be uploading a new version of the textutils with all symbol-tables left intact within a day or two.

QUESTION 1: How do I detect a program that needs a bigger stack than provided by the original binary?

QUESTION 2: How do I figure out just HOW big the stack should be?

QUESTION 3: Is it possible to have GCC tell me when a program is likely to need a bigger stack?

QUESTION 4: What would I need to do in order to make for example the textutils sharable under MiNT? I've tried compiling with the -mbaserel flag, but I keep getting errors while linking (absolute address-errors), and whenever linking goes well, the final binary doesn't work. So far I've only managed to get one big program to compile and run properly with the -mbasrel flag (GNU sed v1.14). How is it done in BIG programs, such as tcsh which is well over 200kb? Is it really necessary to heavily modify the code in order to get it to work?

I'm really sorry if anyone spent any valuable time downloading the textutils just to find out they doesn't work properly. :-(

Well, sure, of course they should. Falcons should also be selling here too,
but they're not available yet.

The fact is, the stuff is available if you want it. The issue wasn't whether
it should or should not be shipping with the machines.

Forget ROM cartridges. CD-ROM discs are uncopiable. Just write games on those. And hey, waddayaknow, people are doing that already... and the Falcon has SCSI built-in, making CD-ROM attachment a breeze.

Of course, there is the market-share problem, but since Atari is a Music industry leader, we might expect other applications (not including games) to bring CD-ROM drives to the customers' desktops.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <81518@cup.portal.com>
Source record: 205854

Hmmm.. the sequence of events when you run KA9Q (double click on NET.TOS) is first the modem should go off hook, then dial... when the other end answers, there should be a pause of several seconds while KA9Q and the host negotiate an IP address for you, and only THEN should the net> prompt be displayed.

On occasion, I've had to redial a couple of times before getting the net> prompt (maybe all the slots at the host are already filled..?)

Be sure that one of the entries in the NET.RC file is NOT commented out with a # character, whichever one specifies the modem speed and phone number you're using.

7074. PRESS RELEASE: MasterBrowse 2.4 (c.b.a.st & atari.archive)

Newsgroup: comp.sys.atari.st
Date: 1993-05-17 07:50:30 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.zeOfMkn8ba6@elfhaven.ersys.edmonton.ab.ca>
Source record: 205707

MasterBrowse has been available now for three months!

Each month, there has been a new version released, and this month is no exception. So, for those who are interested, MasterBrowse 2.4 has been sent to comp.binaries.atari.st and atari.archive (mb24_bin.zoo or MB24_BIN.ZOO). Following the list of new features and bug fixes ia a general description of MasterBrowse for those who have not seen the program.

New Features/Bug Fixes

MasterBrowse 2.1 - 2.4:

-A block can now be expanded into a full window. This allows you to load a large document, expand the part you are interested into a full MasterBrowse window, and then close the original document. This is great for tight memory situations.

-Blocks can now (optionally) be displayed in partial line mode, which means that the highlighting is only drawn to the end of the line (text) instead of from one window border to the other.

-The way the "Movement Base" option operates has been changed. Now the only keys that use the movement base are the application keypad keys. So, the arrow keys move one line up or down (or one character left or right) -- and the application keypad keys move "x" lines up or down, or "x" characters left or right.

-A new method of screen redrawing has been implemented for Monochrome users. The new method is optional, since it uses 32K of memory. If you do not use it, no extra memory will be taken. The new method has NO FLICKER at all. It is used in only two situations (the two most common) -- moving one line up or one line down.

-Find Next "X" & Find Previous "X" now work slightly differently. If you are searching in reverse mode, Find Next "X" actually searches backward and Find Previous "X" actually searches forward.

-Several new key patterns have been implemented:

F1-F7 = Switch to windows one through seven.
F8 = Open New Document
F9 = Close Document
F10 = Close All Documents & Exit

-Moved the bookmark functions over to Window Menu #1, and renamed that menu to Markers instead of Block.

-Added the ability to have window titles stored in MasterBrowse batch files.

-Moved "Save Options" and "Load Options" from the menu to the Set Options dialog. Added a "Done" button to the "Set Display Options" screen (and a "Save" button too) of the Set Options dialog box.

-The escape key can now be used to exit the program and close all windows.

-The following key patterns were changed, so that they would be easier to use (and remember):

Change Window Title
Open Document Batch
Full Block
Clear All Bookmarks
Close All Documents

-Two bugs in the "Create Document Batch" function were fixed;

1) A file could be overwritten without asking the user for confirmation.
2) The first file opened would be written to the batch file twice.

-The screen is no longer redrawn if you are at the edge of the screen when you try to move one line up or down, or one character left or right.

-Some seperating lines have been added to the "popup" menus so that items are easier to locate.

-The HELP dialog is now much more informative, and looks better.

-The "MasterBrowse" dialog now looks much better.

-Moving dialogs now move when you select the "background" of a dialog, instead of the small box that used to be in the top-right corner.

-There may have been a problem with reading the status of the shift keys on the Falcon. This should be fixed.

---A General Description Of MasterBrowse----------

Everyone who owns a computer has, at one time or another, needed to view the contents of a text file. The text file viewer supplied with Atari computers will allow you to do this, but it is lacking in many respects.

MasterBrowse is a replacement text file viewer for any Atari computer, in any resolution with a size greater than or equal to 640 X 200. It offers many features that the Atari text file viewer does not:

* MasterBrowse has a very fast GEM user interface, with special features such as flying dialogs raster-copy redraws for dialog boxes and windows, and pop-up menus. Of course, all functions in MasterBrowse can be accessed through the keyboard as well as the mouse.

* MasterBrowse allows you to have a virtually unlimited number of documents open at the same time, restricted only by the number of free window handles and the amount of memory available.

* MasterBrowse can use the command line (of course) to open documents (or open a document batch). The ARGV, xArg, and standard command line formats are supported.

* MasterBrowse allows you to use all of your familiar movement keys. You can use the arrow keys, the application keypad, or the space bar and the return key.

* MasterBrowse allows you to move in any direction inside a document, as you would expect. What you might not expect is that you can tell MasterBrowse how far it should move when the movement keys are pressed. How about moving two lines down instead of one? or perhaps three lines suits you better?

Do you still want more? Keep reading.

-You can jump to a specific line, a specific page, or any of ten personal "bookmarks" that MasterBrowse supplies (for each window).

* MasterBrowse also offers you the ability to search for up to three strings (at the same time) inside a document (case sensitive or case insensitive), starting at the top of the document or the current position. If a search is performed starting at the current position within the document, MasterBrowse can be told to search in forward mode or reverse mode. After the string is found, another command may be used to find the next (or previous) occurrence of the string. When strings are found, they are placed in the center of the screen and highlighted.

* MasterBrowse also has block functions. You can mark a block off, and then save it to disk, print it, or write it to the clipboard. You (!) can decide how the block is marked on the screen. MasterBrowse can also be told to remove the block markers after a block operation is completed. Unlike previous versions of MasterBrowse, blocks can now be marked using the -MOUSE-. More? A block can now be extracted from a larger document and placed inside a seperate MasterBrowse window!

* MasterBrowse is a master printer. It can print a document (or a block) with page headings, page numbers, line numbers, a description of the file or block, or a combination of the four. It can even print an identification string for those people who share a printer between more than one computer.

* MasterBrowse gives you complete control over your windows. You can cycle through them, change their titles, shrink them, close one, close them all, or get information about them all from the keyboard (or the mouse).

* MasterBrowse saves the positions of the first seven windows, so you
have complete control over where your documents appear and how
your screen looks.

* MasterBrowse allows you to load and save different configuration
files.

* MasterBrowse displays (optional) progress maps, just like the Desktop.

* Every window has a set of block markers and and a set of ten bookmarks
to itself.

* MasterBrowse supports batch files! If you use a certain group of
documents often, just load them up and tell MasterBrowse to create
a batch file. One double-click on the batch file, and they will
all be loaded again.

* MasterBrowse also has support for the clipboard! A block can be
written to the clipboard (with or without text formatting) or the
clipboard can be read into memory and treated like a document.

* Many bugs have been fixed! For a complete list, read the README.NEW
file (which should be in this archive).

The features listed above barely scratch the surface of MasterBrowse!

Source record: 205856

Why not tell your local Sysop to join the international online game Space Empire Elite for Atari ST? Make him choose the NeST SEE net, not Fido SEE or Fuji SEE. Each BBS in the net make a galaxy. There are currently Brittish, German, Dutch, Swedish, Danish, Greek and American galaxies. It would be good for the power balance if another alliance could be formed beside the Brittish, German and Scandinavian superpowers. (United Galaxies of America? :-)

```
Welcome to The Computer Crossroad o93
-------------------------------------

You are welcome to The Computer Crossroad, which is the first of a new
generation of demo parties arranged by the top groups on the Amiga, PC, Atari
and C64 scenes. With "a new generation" we mean that these parties are for
all computer brands, therefore the witty name "The Computer Crossroad".
This is the party for ALL hackers. We mention only the four brands
Amiga, PC, Atari and C64, because we believe that they are the most popular
computers in Europe. With "the first", we mean that there will be a party
here in Gothenburg even next year, and every year from now on.

There will be competitions for demo programmers, music composers and graphic
artists. These competitions will only be for the above mentioned computers.

Where and when?
---------------

The party starts on Saturday 29th of May and ends on Monday the 31st, and
is located at the Swedish Exhibition Centre in Gothenburg, which is the
main exhibition centre in Sweden. The party place is right in the heart of
Gothenburg, right next to Liseberg, an amusement park with masses of
exciting rides, artists, restaurants and the largest arcade hall in the
world. All visitors have a free entrance fee to Liseberg. A few minutes
walk or a tram ride away you find Kungsportsavenyn with pubs, restaurants,
cinemas and discoteques.

Competitions
------------

General rules for all competitions:

- The competitors must be present at the party.
- Only one contribution from each group/composer/artist.
- All contributions must be 100% finished.
- We will copy and spread all contributions.
- All entries must be delivered IN TIME at the information counter near the
entrance.
- All disks must be marked with a name and an address, so we can contact
the competitors, this because one of the sponsors may want to have a word
with the competitors about using their masterpiece.
- Different from other parties, the deadlines are actually DEADLINES. Since
this party is a rather big event, the schedule is tight and we cannot
afford pushing any deadlines, so please be ready in time...
- If a demo requires any user interaction, we want ONE of the competitors
to run the demo in the control room.
```

- All contributions will be looked at by a committe of 10 people, and the best ones will be shown/played on the big screen/sound equipment. This is done because of the limited time we have to show/play all the contributions. 5 hours per computer only for watching demos is quite a lot...
- In the demo compos, the prize money will be shared by the three winning demos, counted at a percentage of their votes. The more votes you get, the more money you win.

Amiga demo - Prize money: 20000 SEK ($2800)

- We will run the demo on a A500+ machine with 1M memory.
- The disk must start from the boot, even if it is a one-file demo.
- We will show the demo for 15 minutes absolute maximum.
- 10 demos will be selected by the committe.

Amiga graphics

- The picture must be loadable from DeluxePaint 4.0.
- 30 pictures will be selected by the committe.

Amiga music

- The tune must be an executable file.
- We will play the tune for max. 3 minutes.
- 20 tunes will be selected by the committe.

Atari demo - Prize money: 10000 SEK ($1400)

- We will run the demo on a 1040STE with 1M memory.
- The disk must start from the boot, even if it is a one-file demo.
- 10 demos will be selected by the committe.

Atari graphics

- The picture must be an executable file.
- All formats are allowed.
- Only the picture must be seen on the screen, no scrolls or other moving things.
- 30 pictures will be selected by the committe.

Atari music (modules)

- The tune must be an executable file.
- We will play the tune for max. 3 minutes.
- 20 tunes will be selected by the committe.

PC demo - Prize money: 10000SEK ($1400)

- We will run the demo on a standard 486-33MHz with ET4000, Soundblaster Pro.
- The demo must be able to run from hard disk.
- 10 demos will be selected by the committe.

C64 demo - Prize money: 5000SEK ($700)

- We will run the demo on a standard C64 with the old VIC and SID chips and the old 6526 timer chips, a 1541 drive, and an Action Replay MK6 cartridge.
- 10 demos will be selected by the committe.

C64 graphics

- The picture must be an executable file.
- All formats are allowed.
- Only the picture must be seen on the screen, no scrolls or other moving things.
- 30 pictures will be selected by the committe.

C64 music

- The tune must be an executable file.
- We will play the tune for max. 3 minutes (phew!).
- 20 tunes will be selected by the committe.

We didn't mention the prizes in the music and graphics compos, because these are donated by the sponsors, and are subject to change.

Please help us

As the walls of the exhibition hall is rather naked, we would want all the groups to decorate it with posters, banners, pictures and other stuff.
Note that we are NOT talking about painting the walls for us!!!
The best decoration wins a prize.

What is there?

Normally, this is where we start bragging about the size of the hall, the size of the video screen and how many dogs we can kill with the sound equipment. We find the equipment sufficient for our needs, and we don't want to brag about it. We take things like that for granted. There is room for at least 2500-3000 people, so don't worry.

How to get there

As the party place is in the heart of Gothenburg, there is no need for a detailed description. Just take the car, ferry, bus, train, plane or

whatever to Gothenburg and find the Swedish Exhibition Centre (Svenska Massan). More detailed information on how to get there is in the folder, which we will send to you when you contact us.

There are busses going from Stockholm - Gothenburg. Price 225 SEK round trip. Contact Mattias af Jocknick (Goblin of Light), phone: +46(0)171-56402

How to contact us

If you have any questions, and want us to send you the invitation folder, there are many ways to get in contact with us.

Write a letter to: Ove Oldberg (Bappalander of Light)
Sveagatan 23
44132 Alingsas
Sweden
Or call him: +46 (0)322-14846 (The official info line)

You can also call: Jorgen Andersson (Joe of LCG)
+46(0)322-15335

Or send an email to: Linus Nielsen (Boogaloo of Horizon)
erenie@moere.ericsson.se

If you want the latest information about the party, these are the BBS:es to call:

X only comes with 8 speedo fonts (and I guess, that Atari is shipping similary
ones). The X11R5 speedo fonts are not encrypted, so they *should* be usable with
a correctly ported bitstream font scaler. In fact, they can be used with Xact.

Actually, the difference is quite large (and it's Queen's English -- the
King has been dead for 40 years. British English is probably a better term,
but I digress.)

I suppose you'd be happy to use a British English dictionary? All you have
to do is add a few words, like color, humor, gray, etc. etc. etc...

I know that digital interfaces are under development (there's an article on stuff previewed at Comdex in this month's ST Applications). I have no idea about how expensive these interfaces are likely to be.

7083. STE Simm - 2.5 Megs

Newsgroup: comp.sys.atari.st
Date: 1993-05-17 12:58:58 UTC
From: ppxpjr@unicorn.nott.ac.uk
Message-ID: <1993May17.125858.12069@cs.nott.ac.uk>
Source record: 205864

Apologies if this is a FAQ.

If anyone has experience of "simmfix.prg" which enables the use of 2.5Meg of Simms in an STE please could they e-mail me their views on it.

Specifically is it worth using for general purpose applications WP's, Games etc. or does it only have value for "well behaved" software?

Thanks.

ppxpjr@uk.ac.nottingham.ccc.unicorn

7084. Falcon Video Registers

Newsgroup: comp.sys.atari.st
Date: 1993-05-17 13:23:24 UTC
From: mdg@ukc.ac.uk
Message-ID: <7245@falcon.ukc.ac.uk>
Source record: 205862
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some falcon hardware registers....

```
-------+-----+-------------------------------------------+----------
###############Falcon030 VIDEL Video Controller ###########
-------+-----+-------------------------------------------+----------
$FF8210|word |VWRAP |R/W (F030)
$FF8266|word |SPSHIFT |R/W (F030)
$FF8282|word |HHT |R/W (F030)
$FF8284|word |HBB |R/W (F030)
$FF8286|word |HBE |R/W (F030)
$FF8288|word |HDB |R/W (F030)
$FF828A|word |HDE |R/W (F030)
$FF828C|word |HSS |R/W (F030)
$FF828E|word |HFS |R/W (F030)
$FF8290|word |HEE |R/W (F030)
$FF82A2|word |VFT |R/W (F030)
$FF82A4|word |VBB |R/W (F030)
$FF82A6|word |VBE |R/W (F030)
$FF82A8|word |VDB |R/W (F030)
$FF82AA|word |VDE |R/W (F030)
$FF82AC|word |VSS |R/W (F030)
$FF82C0|word |VCO |R/W (F030)
```

This is SPOOKY, these register names are almost identical to the register names
in the Archimedes VIDC video controller, so is VIDEL made by VLSI???
So here are some possible register meanings :

HBB - Horizontal Border Begin
HBE - Horizontal Border End
HDB - Horizontal Display Begin
HDE - Horizontal Border End

VBB - Vertical Border Begin
VBE - Vertical Border End
VDB - Vertical Display Begin
VDE - Vertical Border End
VCO - Control Register(??)

Which basically means the Falcon VIDEL video controller is VERY flexible.

Griff.

Usually, I do this by running a pretty heavy test script through the
program. If it crashes, it likely needs a bigger stack. :)

> QUESTION 4: What would I need to do in order to make for example
> the textutils sharable under MiNT? I've tried compiling with the

> How is it done in BIG programs, such as tcsh which is well over
> 200kb? Is it really necessary to heavily modify the code in order
> to get it to work?

Shared text is only possible if the data+bss size of a given program does
not exceed 64KB. You can find out about the sizes of the program segments
by issuing a `size' on the executable.

Also don't forget that you have to use the sharable versions of the
libraries in order to link them with the program (biio.olb,
btermcap.olb...)

Sometimes, some modifications to the program can help to make it sharable:

o Often, some "const"s have to be removed in order to move a data object
which references another non-const data object out of the text
segment.

o To decrease the size of bss+data, you could try to decrease sizes
of buffers (this is what I had to do in order to make tcsh 6.03
sharable), or allocate buffers dynamically where they normally
would be allocated statically.

Hope that helps,
Michael

Sorry Bob, I guess I should have made my post a little clearer. When I FTP
to a site (i.e., I am already connected) I log in as Anonymous and then it
asks for a username@xxx.xx.xx.xx or it gets rude. I try to reply with my
three initials and then the ip address that shows up in the upper left-hand
corner of my screen when I start up. Some sites reply that the address is
invalide and to please enter a correct address when I log in as anonymous
next time. So now, what should I use?

Oh brother... now what have we started? "My online service is better than your online service?" Gimme a break, Bob!

The one price anytime of day is nice, but I venture that the vast majority of Atari users are usually only able to log on in the evenings anyway, what with work and school. And of course, weekends and holidays are 24 hours at the non-prime rate.

As I said in my original reply, I find GEnie to be the best value for Atari users. Users of other platforms may wish to investigate CIS or Delphi. I was wrong in one area, however... the charge for accessing the computer roundtable forums in $6 per hour, non-prime time, not $8. So shoot me. :)

First comment is that all contracts are negotiable. No matter who you deal with in life, they'll always try to shove a piece of paper in front of your face and tell you that you have to sign it "as is" because it's the standard document. Bologna. The contract is a starting place, which lists everything they'd *like* to get. You need to strike out those things you're not willing to give, and add those additional items you want.

> I'm afraid that I will not be permitted to do any IBM un-authorized
> programming.

This seems strange. I can't say with 100% certainty, but it seems to me that I've seen programs floating around the PC freeware/shareware arena that were contributed by IBM employees?

> Does anyone know how to copyright ideas for software before going to work for
> a large corporation. I don't want to make any money off of this software,

You can't copyright ideas.

> ...list of projects/ideas deleted...

> Is a statement like this to the UseNET a good enough copyright? I don't
> want to be unfair to IBM, but I would like to still work on these
> projects without having to worry about breaking the law. This is USA law.

No, but if you include this section as an addendum to the contract with the stipulation that it be incorporated by reference you will protect your interests.

As a side note, I can't predict how the particular division of IBM that you're dealing with will react to such revisions, but if I were an employer it would indicate to me that you had read the contract, considered its ramifications, and were attempting to deal in good faith (rather than just saying "yeah, sure" with no intention of complying). They, on the other hand, may attempt to browbeat you. Who knows?

I guess at this point I should mention that I am not an attorney, nor do I play one on TV. The above should not be construed as legal advice, simply a personal observation. If you want to be sure of yourself, you should consult with an attorney. Especially when you're dealing with

IBM (who has *lots* of attorneys).

>
> "International TOS Software Catalog : a 500-page catalogue reviewing
> almost all software available for the ST/E, TT and Falcon. The reviews are
> small but well done with screenshots. The price is very low: $12"

One clarification, just so that no one is confused. The product descriptions in the catalog are *not* reviews in any sense. They are advertising materials, originally prepared by the products' manufacturers, then toned down a bit by the person who assembled the compilation (Dorothy Brumleve, I think, President of the IAAD).

I know this is true, because I wrote one of the descriptions (for a universal MIDI librarian called Omni-Banker ST, distributed by Paradigm Software Products). And I know they were toned down because they removed my claim that it "supports more instruments than all other universal librarians on all platforms put togeth-er" (even though the claim was true, it probably sounded too much like hype).

The catalog was a lot of work for Atari, and I thought they did a good job. There's ordering info over on GEnie. If anybody needs it (and nobody beats me to it), I can pull a copy over here.

Disclaimer for the flame sensitive :-) :-) :-) :-) :-)

If you folks whine loud enough and you give me a copy of Inside the Macintosh with the Apple-Talk standard I could write a simple assembly program that diverts printer data to the LAN port in Apple-Talk format :-)

Real stuff:

Really, it shouldn't be that hard. I could see the biggest part of the project muddling through Apple-Talk. The rest is simply wedging a routine into the printer output handler that sends the data through the assembler routine and then out to the LAN port.

Postscript? Well, use Speedo-GDOS and Compo Script and you won't have much of a problem. Yes, yes, for those of you who think there should be Postscript drivers built in, just think about how big a program Compo Script is and then think about whether or not you'd like to have that loaded in memory as a printer driver. :-)

Actually, with Multi-Tos using your favorite Speedo Program and CompoScript shouldn't be that painful.

Well that's my 0.00347234 cents (with uncertainty in the 8th decimal place)

7097. New Falcons

Newsgroup: comp.sys.atari.st
Date: 1993-05-17 19:04:42 UTC
From: cstadbs@csv.warwick.ac.uk
Message-ID: <1t8nkaINN3bh@lily.csv.warwick.ac.uk>
Source record: 205874

While I was in London this weekend, I went in to Silica Systems to see if they had any Falcons in the showroom.

I could not find any, so I asked the assistant if they had any. He said that Atari UK had taken them all back because there is a 'new model' coming out next week, which Atari would give them instead. This new model appears to be the one in the new case, the 'consumer' version as Atari UK calls it(which they have been talking about for the last few months).

Maybe this will be the Falcon with all the promised goodies!?

Well, there are several companies distributing software (applications and
games, too) on CD-ROM for the PC and Mac. But it's just not feasible to do
so for the Atari, IMHO, because (a) CD-ROM drives are not widely available for
the Atari and (b) there are not enough Atari users (with _or_ without CD-ROMs)
out there to justify the cost of mastering a CD-ROM disk. Granted, it costs
a LOT less than it used to, but still... who you gonna sell it to???

Sound familiar? ;-)

Actually, I had heard that one change planned for the Falcon was that instead
of using the 1/8" mini-audio input jack, they would instead modify it to use
two RCA-type connectors for the convenience of the MIDI market.

(personally, i think if Atari were really serious...they would have put this in
from the start, or if they REALLY wanted to cause a stir, use something like
the Peavey DMP SX which accepts both 1/4" connectors and 3-pin XLR
connectors...)

CD-ROMS aren't really all that bad on contiguos reads. When you
copy off a CD-ROM, there's a small delay, and then you start off. It's
faster than a flopyy, but slower than a fast HD.

I think alot of software could be designed where it never had to
instantly read something off the CD, and so the slower read time
wounldn't matter. Infrequently accessed items could be left on CD
as well (like Help stuff).

Games easily fall into this area....as well as giving
you a large space for Data. Nice sound, oodles of great graphics, reams
of data.

Still, I don't want to have to put in my Calumus CD to run Calumus.
The might work for single-tasking but doens't cut it for multi-tasking.

And, not only is alot of Mac software available now on CD, soon it will
all be available on CD. Apple is going to put out CD's with every
commercial Mac application on it. When you want to buy an app, you'll
call them, give them a Charge card number, and they'll give you an
authorization code. Docs will be on the CD, or be able to be purchased
from the software house. I don't know if this'll work...but it's an
interesting experiment.

> with
>a correctly ported bitstream font scaler. In fact, they can be used with Xact.
>...

The X fonts which are shipped use customer number 0 with an encryption matrix of all zeroes. When you build a Speedo font engine you compile in the customer numbers together with the font encryption matrices. The customer numbers are stored in a private offset in the Speedo font header, which you then match against your customer numbers and retrieve appropriate encryption matrix which you compiled in; note that the font header includes only the customer number, not the encryption matrix.

Atari's code includes two customer numbers: Atari font encoding, and retail font encoding, these are two distinct font encryption matrices. Retail fonts cover 200 (or so) standard fonts which are available off the shelf, Atari font encoding is Atari's private encoding which Bitstream will encode fonts with for OEMs. SpeedoGDOS does not include (at least not last time I looked) include customer number 0 or the associated encryption matrix.

IIRC Atari are shipping 14 fonts which partially overlap the X fonts, but not completely (I think X includes Courier which Atari don't).

Date: 1993-05-17 21:29:54 UTC
From: awest@ub.d.umn.edu
Message-ID: <1t904iINNomq@ub.d.umn.edu>
Source record: 205883

It seems I've seen a few of these requests lately, so let me add mine to the pile...

I am looking for an ICD Host Adapter to hook a hard drive to my 1040ST.
Pleae email to my Compuserve address if you have one as I will be losing net access soon...

Reply to: 75210,3415@compuserve.com

with subject "Host Adapter"

Thanks!

Source record: 205886

] WOW! Can you tell more about v3 cause I didn't know they were working on
] upgrade. Will this one finally include the Zmodem FDT instead of using XY

Aaron has promised internal protocols (Built into the main .PRG), and
Z-Modem will be included along with Y-Modem G
Full VT-100 emulation.
Full Resolution independancy (better than what it already has), so on
a falcon in 640*480*256 modes etc, you can use 16-color ANSI! (Nothing
new really, as other programs have been doing it for a while, but
the current FZDSterm is pretty old as this time)
Newer & faster interface (written in 100% assembler language, rather than
the slow, and large GFA-Basic compiling).

We'll see what it finally comes up with soon! I haven't been able to
ask the authors personally, as the idiots on the F*NET have decided
to drop atari-net from the network, thereby reducing the number of daily
new messages from up to 250, down to about 30, and losing access to
a large percentage of overseas people (Including Sean Price, although
I haven't tried Aaron yet, but I don't fancy my chances).

7107. MultiTos

Newsgroup: comp.sys.atari.st
Date: 1993-05-17 22:36:27 UTC
From: dja_gow@lentil.uwe.ac.uk
Message-ID: <1993May17.223627.4740@pat.uwe.ac.uk>
Source record: 205885

I have seen multitos and I am not impressed. Since nowbody other than developers can get hold of Unix. I will be put my efforts into Linux 680X0. Linux for those uninitiated is a free Unix clone currently for the i386/486 processors. Linux is currently making the journel to the 68000 platforms. There is a group working on a TT version. I am unsure of a version for machines below the TT, ie ST, STFM and STE. I do hope there will be a version for MSTE.

What this space!

Jonathan

It's a NeXT compatible DSP port.

As part of my MSEE project, I designed a device for the NeXT using Crystal
Semiconductor chips, that provides AES/EBU and S/PDIF in/out and 64x
oversampling A/D at 48K and 44.1K. The schematic is in ORCAD and I plan to
reproduce it using PADS so I can get postscript output.

I'll probably be sending out the schematic for a small fee.
I have two working prototypes.

ROFL

Atari anounced a CD-ROM player about four years ago, again three years ago and again two years ago. Everytime "real soon now". Finaly they dropped the complete project. So Atari will not bring CD-ROM drives to the customers desktop, other companies are doing it right know. Atari will probably jump on the bandwagon later on.

7110. Cross compiling with GNU C for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-05-18 00:29:05 UTC
From: roy@eckerd.edu
Message-ID: <1t9akh$9b9@eckserver.eckerd.edu>
Source record: 205900

I'm going to start doing some programming soon.. I wish to do all
of my programming in C++... Now, there are no C++ compiler I know of for
the ST except, of course, GNU C. I only have 1 MEG of RAM though...

So, it seems to me I should be able to compile a GNU C cross compiler for
the 68000 on the Suns at school, then link the .o files (hardware
independant stuff) to my friends GEM front-end code, which will be
standard ANSI C, compiled with Lattice C...

Does this sound reasonable? (Compiling 68K code with GNU on a Sun, then
linking the .o's to the other code with Lattice C.)

Thanks for any information. :)

Ah... I've gotcha now, Bernard..

The first line in your NET.RC file should have your "name path"...

For example, mine is bobr@aa.mi.us (Ann Arbor, Michigan, USA)

Those systems must want to see a name path, not the actual IP address.

(Some will even take anything as long as it's in the proper form..
"dufus@home" satisfies a lot of them... :)

REally, anything should work.. even those that complain and tell you to use
the "real thing" next time, will usually let you in.. it's more a matter
of following etiquette to supply your "real" identity.

BobR

7114. Zmodem rz.prg question

Newsgroup: comp.sys.atari.st
Date: 1993-05-18 03:13:00 UTC
From: boyd@gauss
Message-ID: <C77Cxp.421@mailer.cc.fsu.edu>
Source record: 205898

I am experimenting with adding Zmodem capability to Uniterm (via a keyboard and popup macro). So far, the nicest zmodem implementation I have come across is rz.prg (in grzsz18.zoo, from atari.archive.umich.edu). I only have one problem: how do I specify something other than the current path to download to? Xyz.ttp does this with a command line argument, but the rz.prg doc file does not seem to mention anything like this (I say "seem" because it is in German, which I cannot read). Is there a way I can change the current path in Uniterm right before I execute rz.prg? This (or a previous version of this) is the program that Rufus uses for Zmodem downloads, and Rufus allows you to specify a download path. Any ideas?

On another note, I would be perfectly happy with xyz202b.ttp, except I get CRC errors with any files larger than about 500k. Has anyone else had this problem? I tried playing with the window size, without success.

Thanks in advance for any help.

Falcons come standard with a SCSI II port, so adding any third-party
CD-ROM drive is now a reality.

You need Fontkit - it is not only a great GDOS font editor, but has many
neat little accessories, which among other things allow many (most?) WPs
to work in Hebrew, Greek, whatever.

Actually, Jeremy Hughes wrote it during his PhD, to allow him to do just that ...

Nope. No sound/midi/serial port. I don't think it will be supported in the near future, either.

>
>Sound familiar? ;-)

This is the old vicious circle: no sofware available, no hardware sold -> no hardware sold, no software made...

I think the situation could be bettered if Atari made an Atari brand drive. Then at least the dealers would know that it would be available. In addition, consider a retailer disc consisting of demos of most Atari software available. Then all customers out there could try things out and decide if it's worth their money. I think this could reduce piracy (i.e. all downloads made from the pirate boards just to check out what a certain piece of software is like. This is IMHO generating a *lot* of traffic on those boards) and make devs (especially the US ones, who generally suck big time in the interface dept.) make better apps due to the fact that the competitors are only a few bytes away :-)

Think about it!

From: moffatd@dcs.glasgow.ac.uk
Message-ID: <C77yLD.LD@dcs.glasgow.ac.uk>
Source record: 205760

You ask whether or not it would be possible to compile 68k code on a sun
Are you using sun3 (68k) or a sun4 (sparc) if the latter I think not, but even
the former would be difficult.

I suggest what you do is build the sozobon cross-compiler, available from
a.a.u.e (or one of it's many mirrors)

It does come with comprehensive instractions on how to build it.

It is not C++ but just plain old C, but this should get you started anyway.
And you will be able to compile and LINK on the sun.

How that helps you

7128. Problems with GNU C++

Newsgroup: comp.sys.atari.st
Date: 1993-05-18 11:10:32 UTC
From: thiele@quando.quantum.de
Message-ID: <1993May18.111032.23632@quando.quantum.de>
Source record: 205761

```
Hello everybody,

I have a problem with the GNU C++ compiler:
When I try to compile C++ programs using static variables in class
definitions, the linking fails.
A simple example:

#include <iostream.h>

class Test
{
public:
void try_it();
static int var;
};

void Test::try_it();
{
var = 1;
}

main()
{
Test one;

one.try_it();
cout << one.var;
}

The compiler has no problems, but the linking will faile with the
following messages:
test.cc:12: Undefined symbol Test::var references from text
test.cc:20: Undefined symbol Test::var referenced from text

Is that a problem of the compiler or of the linker? I use the following
versions: CPP2.3.3p2, C++2.3.3p1, GAS1.38pl4, linker pl33

If is it possible to compile the program above, what version of the
compiler (or linker) is neccessary?

Thanks in advance

Holger

>

I think the important thing to remember is that GEnie has over 20 RT's
that are 'free', part of your $5/month. I spend hours on GEnie a night,
with no charge. Hundreds of Babylon 5 posts a week, nearly a hundred
a day about animation/ANIME in the Japan RT, lots of cool math and physics
chat in the Science RT, raytracing/etc. discussions in the Photo RT, and
on and on... I regularly read 20 RT's, only one of which is a pay
RT, the ST RT. My bills end up being about $10/month, that extra
$5 coming from reading the ST RT once or twice a week...

$10/month for 3-4 hours a night... Just can't beat it.

Actually, Darek's missing a big market here then, as ST
midi programs are/were the one thing you'd want to bring along to a PC.
Of course you can pick up a 1040 now for cheaper than a Gemulator,
and I've heard rumours WIndows has timer problems for midi that make
rewriting the Keyboard interupt on the ST look easy.

Let's see:

Not likely, way too slow. Not unless you load MiNT (the MultiTOS kernel)
and use the minix filesystem; minix filesystems are NOT accessible from
normal TOS, so your minix partitions will only be available if you have
MiNT/MultiTOS and the minix filesystem loaded. Not likely, way too
slow, and the screen is too small, unless you get the ScreenBlaster.

Ah, but there's a difference between "can use" and "comes with".
SpeedoGDOS can use normal bitmapped GDOS fonts, but doesn't come with
any. That feature of X is probably for people/apps that require
standard outline fonts for DTP or whatever.

That's really smart... You'd think Speedo would keep track of bitmapped
and outline fonts separately (hey, there's separate caches for them),
and resolve ID conflicts between them... ESPECIALLY if the system font
is one of the ones conflicting!

Remember all those really good games on the Spectrum and C64 ?
Like to play them once again ?
We are looking for some ideas for a game to program. Rather than think up something new, we decided to do an enhanced copy of one of the great old games for the ZX Spectrum or C-64. Except we can't decide which one. So get your votes in now! Tell us which classic games you would like to see on the ST.
Please post, or email to r.mellish@ic.ac.uk or ha.jones@ic.ac.uk, and we will summarize if there is enough interest.

The Derivative Design Syndicate - "One of our games is both the same."

P.S. Those waiting for MolSys v1.0 : It'll be ready Real Soon Now!
No, I mean it! Really!

Speed doesn't seem to be a problem for all those PC CD-ROM game producers --
especially those who include full-motion video in their games...

Once you actually get to the data you want, you can pull it off CD-ROM at
about 150K per second, and there are now drives that can deliver 300K per
second. Nimbus are reported to have developed a new pressing system that
doubles the transfer rate using ordinary drives -- I'm not quite sure how
they manage that!

What people are asking for is a driver that *generates* PostScript, not one
which *rasterises* PostScript. CompoScript is a large program because it
rasterises PS -- all we want is a Speedo driver that takes VDI commands and
spits out equivalent PostScript. That really shouldn't be too hard.

Mmm, what ever happened the ATW. I managed to see the ATW 800 one year
at a computer show in London. ST World, just about the best serious atari
user magazine followed like a hawk. With much the same varosity as ST Format
are watching the Falcon.

ATW was supposed to come with Helios and X windows. Helios for those who
don't know is a operating system, very much a kin to Unix of some flavour.
The only and major difference is that Helios runs in parallel.

7144. HD problem

Newsgroup: comp.sys.atari.st
Date: 1993-05-18 14:31:37 UTC
From: mjl-b@minster.york.ac.uk
Message-ID: <737735496.19036@minster.york.ac.uk>
Source record: 205787
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a Seagate SCSI hard drive with a GE-Soft host adapter. When I switched it on the other day, it didn't make its usual power-on-self-test noises -- it seemed to get stuck and make "tock tock" noises instead.

I switched it off, let it spin down, and then switched it back on. Resetting the ST got a system that booted, but I got lots of messages about "Data on drive C: may be damaged" etc.

So, I ran the GE-Soft utilities, and it found a new bad sector in the partition that is Drive C:. I marked it as bad. Everything now worked properly.

Now, when I switch on the drive, it performs its power-on-self-test as before. However, right at the end, the "Access" LED comes on and stays on, and the ST does not boot. Resetting the ST twice will switch the LED off, and the system performs normally.

Does anyone know what's wrong, and if I can fix it?

Hi Atari Lovers,

I'm from Amiga land (don't hit me, and I won't hit you) and I was wondering about this piece of hardware called DSP, which I've heard that the Falcon has. I know that the Amiga will support a DSP too later this year, and I have some questions regarding the use of such a device:

Since the DSP is capable of playing several voices of 16-bit sound, will that save me from buying that $2000 EPS-16+ keyboard? I mean, is it possible to hook up a very simple keyboard, which only has midi in/out, and then use the DSP as the main unit?

Maybe it's a stupid question, but I'll be glad if someone tried to answer...

Huh? There are lots of plug-and-play CD-ROM drives available that
work fine on Atari's. And if Atari *did* make an "Atari brand drive"
what makes you think "dealers would know it would be available" any
more than the raft of other Atari products that are *not* available?

But if I went out and bought a CDROM drive, what would I put in it
(for the Atari)? Nobody will spend time/money creating the ROMs
with the small/diminishing customer base that currently exists.

> consider a retailer disc consisting of demos of most Atari
> software available. Then all customers out there could try things out and
> decide if it's worth their money.

This was suggested, and even attempted, but never got off the ground.
Unfortunately.

> I think this could reduce piracy (i.e. all downloads
> made from the pirate boards just to check out what a certain piece
> of software is like. This is IMHO generating a *lot* of traffic on
> those boards).

An interesting concept, and I suspect you may be right. I certainly
know that I hate to spend the bucks to buy some software that's
been hyped to the max in ads, only to find that it's incomplete,
bug-ridden, poorly documented, badly designed, or all of the above.
It makes you very cautious about future purchases.

> and make devs (especially the US ones, who generally suck big time

> Please post, or email to r.mellish@ic.ac.uk or ha.jones@ic.ac.uk, and
> we will summarize if there is enough interest.

Arcade games: Omega Race, Frogger, Pengo, Galaga, Tempest.
Old Atari 8-bit / C-64 games: Encounter (pleeeeeese!), Rescue From Fraculus

The one Encounter-like game I have found for the ST is Backlash, which is
really good, but too repeatative (it is almost there, only a few things would
be needed to make it a must-have).

The big problem with a Tempest clone would be the controller. I would opt
for the mouse, I suppose. I wonder if the old 8-bit paddle controllers would
work on an ST at all? If so, it would be very cool to have the option to
use them. Also, for any joystick games, support for the 4 player adaptor
would be nice, as they are so easy to make.

...(extracted)...

The DSP is a Digital Signal Processor chip which can be used to filter, analyze or synthesize the audio signals in digital form. By itself, a DSP can only process digitized waveforms.

Certainly the $800 Falcon, which includes the necessary MIDI interface, Analog to Digital, DSP, Digital to Analog, and Software components, could act as your main unit. You should check your Amiga contacts for information on future Amiga DSP systems.

Consdider it "given" then, Bob. I was simply responding to a user's querie about GEnie and was not aware that CompuServe had lowered it's prices to something approaching a more reasonable level. Thank you so much for the enlightenment and my sincere apologies for ruffling your feathers.

Personally, I will return to the occasional login on CIS just to see what's up or to investigate one of the pc forums now that I can do so without mortgaging my house first. If they now have a superior service to offer the ATARI user as compared to GEnie's, I'll happily report that here on the net.

But somehow... I doubt that's what I'll find. :)

Hey, that's a great idea! Unfortunately, it's one that Atari already had.
Last year, Atari announced they were going to produce this great demo CD-ROM
and had all the developers jumping through our collective rearends to provide
program demos and docs for inclusion on the CD. To make a long story short,
it never happened. <sigh>

>what makes you think "dealers would know it would be available" any
>more than the raft of other Atari products that are *not* available?

Well, let me tell you something. When Apple first introduced their drives, they were *expensive*. Several others had drives on the market too, but Apple's sold more due to the fact that people felt more secure with that product since it were Apple brand. *I* know that you can plug and play a SCSI CD-ROM onto the Atari range (I'm using a standard Apple CD150 from time to time), but most people, dealers included, does not know this. Therefore, they don't carry it in their shops and show 'em off to people. What I mean is that a lot of people would feel more comfortable about buying a n Atari brand CD ROM drive even though it would cost a bit more than a similar un(Atari)branded drive (this was supposedly why Atari didn't brand the Chinon drive last time, it would be $50 over the street prices for a Chinon branded drive).

Atari made some deal with PLI some time back, but I don't know if it's still in effect. They were supposed to write 'compatible with Mac, PC bla bla Atari computers' in their ads for 3rd pary HD's etc.

>But if I went out and bought a CDROM drive, what would I put in it
>(for the Atari)? Nobody will spend time/money creating the ROMs
>with the small/diminishing customer base that currently exists.

Again, Atari must do something. Apple has pushed the CD-ROM media to an all time high since they are making promo discs and urging people to make use of the medium. I would strongly advise Atari to put all their developer docs, dev software and sample code (do they make this????) on disc in the future. Cheaper in production, saves a hell of a lot of trees and saves 'em enough on stamps to make a new Falcon case :-)

On a sidenote, *I* am willing to spend time and money making something on disc for the Atari community. I do not, however, have the funds right now :-(I exchanged a couple of mails with Bob of Walnut Creek CD-ROM about making an Atari disc last fall and they were interested. I urged him to contact Atari for eventual co-funding. I've been busy since that time so I haven't gotten back to him on that yet, but we'll see.

>bug-ridden, poorly documented, badly designed, or all of the above.
>It makes you very cautious about future purchases.

Right. That's the way I feel as well. In addition, if more people saw a
product that had potential, but missed something, they could give feedback
to the dev about it.

>> and make devs (especially the US ones, who generally suck big time
>> in the interface dept.) make better apps
>
>Hey! Smile when you say that, pardner. I'm a US software developer.

Hit a nerve there? :-) (just to be safe) I haven't seen your apps, but I'm
really sad to say that there are a *LOT* of overseas devs who hasn't got a
clue about interfaces. I mean both functional _and_ aestethical. If you
look to the German scene, it's more common with *real* checkboxes and
radiobuttons in dialogs, titles that *don't* look like buttons (check out
AtariWorks...OK, he's Indian) or drop down menus (watch that shaded box),
have buttons that look like they have caught a growing disease (yeah, about
8x11 inches or so) and last but not least, that *have* to have a raster in
dialogs. I'm exaggerating a bit here, but I think you get my drift.

>> due to the fact that the
>> competitors are only a few bytes away :-)
>
>Oh, I guess you did, Jon. :-)

Gotta cover my back!

BTW, wouldn't it be great with a one week developer camp for Atari devs
somewhere out there? Come together, share ideas and agree on some standards
or someting? All we need is some $$$ from Atari...

I have the following atari system for sale.

1. 520st cpu with 2.5 meg of memory, new tos roms.
2. sm124 monicrome monitor.
3. Spectre Mac emulator cartridge with Mac Roms.
4. Debugger cartridge.
4. ICD AdSCSI ST Series Host Adapter, 1992.
5. Adaptek 4070 scsi->rll hard disk controller.
6. Micropolis 1325 80 meg mfm / 105 meg rll hard drive.

This is a complete system with the exception of a hard disk case/ps. If
you supply a hd case with power supply I will put the system together for you.

The hard drive currently has three mac partitions of 15 meg each and the
rest of the drive contains gem partitions.

I would like to get $675.00 for the system. If you want pieces please make
a offer. I've sold out and bought a 486 boat anchor.....

On this subject, according to a local dealer, some new mac, currently in the works, will have 2 DSP chips in it. Pretty powerful stuff! For a bit of extra money, as well as the built in micro-phone, you can also get a built in video-camera type add-on. So, you can network your machines, and talk to others around the office via that!

Motorola has also got a new chip, running at (I think) 80Mhz, without any clock doubling etc. Which is a fair bit more powerful than Intels Pentium chip (the one to be in the '586' (now the P5).

Atari has their Jaguar, which if it sees the light of day remains to be seen, and if it isn't out by this christmas, Sega etc. will sure beat them to it, but if they get it out, it's going to put a lot of atari product on the shelves!

Lotsa changes.... This time, 1995 - we won't have a clue what's going on! (Most of us don't at the moment....)

I read a long time ago, they couldn't sell them for a competative
price, so they decided to let the other parties make the drives.

They had one made and working a LONG time ago.

Looks like everybody finally got the rates right, except that the prime time rate is now down to $12.50 per hour. Actually most all of the RT areas except for those which are computer specific are included in the *BASIC $4.95/month fee. This includes the Medical, Hobby, Scuba, Law, Radio & Electronics, Food & Wine, and not least Mine, A Law Enforcement RoundTable. (yup I'm predjudiced, but I made my decision to be on GEnie after several years elsewhere about 3 years before I had my own RT there.)

Outline is a stand alone vector graphics program, but as it only produces
CVG files, it is not a lot of use without Calamus.
BTW I have a Mega STE and have upgraded from Calamus 1.09n to Calamus S
and Calamus S is so slow even at 16 mhz that I have gone back to the
"old reliable" 1.09 !(just for info)

anyone want to buy a German language version of Calamus S? :-)

ICD utilties include a program called bootfix, which "programs Seagate and Quantum hard disks to reliably boot the first time". It is apparently a configuration that the hard disk stores in non-volatile memory. This may be related to your problem. Anyway, there are versions of the ICD software available via ftp (ftp.uni-kl.de might have it). The program is only run once, to initially program the drive. Give it a try, it couldn't hurt.

Also, the ICD formatter can be told to do multiple passes, which will usually root out any transient sector problems (which a single pass can miss).

7168. zoo 2.1

Newsgroup: comp.sys.atari.st
Date: 1993-05-19 01:50:09 UTC
From: braner@trantor.emba.uvm.edu
Message-ID: <1993May19.015009.19369@uvm.edu>
Source record: 205706

I've gotten zoo 2.1 from a.a.umich and as has been posted here recently
it has some problems. "zoo x file" does not work. "zoo -extract file"
does work, but that does not allow one to use the modifier letters such
as "zoo x: file". There are some .zoo files I got off of a.a.umich that,
when listed, show file names STARTING with '/'. (How come?) When I try
to un-zoo them with "zoo -extract" I get 2-bombs. Any workarounds?

- Moshe

Yes, I'd be happy with it. Differences noted. So what. You add them as you use them, and soon, you have no problem. I don't know anybody who really cares if I spell color colour or gray grey. Those that do, I must label as language pedants.

You know, I can't see how hard it would be for someone to type in a supplementary dictionary and distribute it. Send it to SoftLogik.

>independant stuff) to my friends GEM front-end code, which will be
>standard ANSI C, compiled with Lattice C...

I don't know if the object code of GNU C and Lattice C are compatible -

You could just use my GEM++ C++ class library (written in GNU C++ of course).

(If I plug GEM++ one more time, I think I'll have to rename it "Hoverjet
Simulator" or something ;)

Seriously, GEM programming lends itself VERY well to C++, since the GEM
system is already an object-based system (even one of the data types is
called "OBJECT"!). Merely using C GEM libraries, you'll have to be
careful to still have your own Object Oriented layer on top of the bare
C code. GEM++ is fairly minimal in that it provides little more than
what could be attained in plain C (except it is ten times easier to write
GEM++ programs than plain C programs), so your friend's C code will
probably provide you with more features in an absolute sense.

> test.cc:20: Undefined symbol Test::var referenced from text

You don't define int Test::var; anywhere - that's what it's complainging
about (quite clearly too).

Add this line:

int Test::var=0;

To your code.

I've run into a problem recently, which I hope someone can help me with.
Here it is:

I recently was on GEnie (At a friends house, actually, who just got ann
account) and finally got my hands on the Speed Of Light GIF viewer. One
problem, it takes some new version of an LZH extractor, which was LZH'd
itself. We downloaded this. It tells us that for this we need yet
ANOTHER new LZ
H extractor, which is ALSO LZH'd! Well, I have'nt gotten any new
extractors in over 3 years, as that's when I shut my board down, and
there are NO local ST boards around.. So my question is, is there
anything on GEnie that will let me extract LZH201.LZH (I'm pretty sure
that was it) that is an executable file? Or am I going to have to go
through a maze of extractors? Please include filenames.

Thanks.

Not quite.

It's "CD-ROMs are huge, so let's make our datafiles so big that to
copy them people need a large hard drive. Forget copy protection,
just make them too big to copy easily."

This (IMO) is why there is so much animation, sound support, etc in
CD-ROM material - programmers have been freed from the normal
drive space constraints, and are encouraged to put as much
auxillary material on the disks as possible....

Well, it was OK. It got me gripped for a few 10's of minutes, the problem is (obviously) the speed. Texture mapping on a bit-planed machine is not realy on. Mr Tony Bennet (old UNT mem), with encouragement from myself, has developed a very fast texture-mepping routine that CAN ROTATE ON ALL THREE AXIS for the ST, and the version for the falcon is X times faster because of the extra speed, but it is then another 3 times faster when in true colour mode due to the ease of plotting a Pixel (1 word, instead of 4 words per pixel in 4 bitplains -16cols).

njp_summ@csd.uwe.ac.uk -CSD please!, not to one of the many workstations (eg kiwi, peanut, honey etc, CSD ONLY!)

< ..... >

Hello again,

I have to confess that I was very, very wrong to ask about an error in
the compiler.
In C++ it is not sufficient just to declare a static variable in a
class definition, because it is only a definition! It is necccessary to
declare the variable after the definition outside of the class definition.

Sorry to all of the GNU writers, but I have found this way of declare
static class variables in a C++ teach book. Because of this I asked about
an error in the compiler instead of searching the bug in myself!

Sorry again and thanks to the people who helped me.

Holger

I WANT PAGESTREAM III!!!!!

I have got Pagestream 2.2, and it has killed everything else on ALL other formats (macs, pc's out workstations) for ease of use and productiveness.

I have converted many major anti-atari (for the reason the word 'atari' is used) people to use Pagestream to help to all their assignments, projects, and OHP slides for our course. Mind you, using it on 21" Eizo flexi - TT's gave it an advantage....

Anyway, was it just me, or did I see in (I think) ST USER, or REVIEW, a screen shot of the contents of one of their hard drives, with a directory named something like

PAGESTREM3.BETA (you now what i'm saying...)

```
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
;;; I really dont like Calamus much.....
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
;;; (Harsh words indeed there, Nathan ....????!@#$
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;

With the falcon I saw, there was a DSP assembler program and debugger (from Atari)

You mean the digital output? Hey! Why DO people sample from CD, when you can (should be able to) just nick the digital data straight from the disk.

No idea about connections though......

7181. Atari licenses Cinepak from SuperMac

Newsgroup: comp.sys.atari.st

Thrashman! I used to play it every day (almost) when I still had my
C-64! If you don't know this game, here is a short description:
You had to pick up garbage at houses.
Little dogs would chase you.
It had a top view of the area, with a road in the middle and houses by
the side. garbage collecting against time, and there were other things
that hindered you while collecting the garbage that I can't remember
right now.

>are watching the Falcon.

I spoke to Les Player, ex-product manager at Atari UK in charge of the ATW project, some time ago. He said that Atari eventually got around to manufacturing the ATW. A production line was tooled up in Germany, rather than Taiwan (the idea was that Germany and Europe would be the ATWs best market). However, the boards produced never worked properly and after fiddling around trying to sort the production line out, the whole thing was given up as a bad job.

>ATW was supposed to come with Helios and X windows. Helios for those who
>don't know is a operating system, very much a kin to Unix of some flavour.
>The only and major difference is that Helios runs in parallel.

Almost right. The clever thing about Helios is that it's a *distributed* operating system. It had a Unix-like interface, but since it didn't rely on shared memory, things like fork() were difficult to implement. The fact that it was distributed meant that parallel execution was really a by-product

>Yeah I seem to remember Pherillion Software or some company by that vague
>name had a hand in the ATW development.

Perihelion developed the original design. The company was then split into Perihelion Hardware, which Atari bought, who worked on the design of the ATW. Perihelion Software worked independently on Helios.

Composcript is not just a printer driver. It is a complete post script interpreter, so an entire programming language. It has drivers for lots of printers. A postscript printer driver for Speedo shouldn't be that big. Maybe it could even be smaller since not everything has to be translated into bitmaps first, but could be sent like some sort of meta-file (in postscript of course).

Atari MEGA ST4 with 4 MB RAM
1 floppy drive
65 MB hard drive (Model: SEAGATE ST 279R)
12 R High Resolution B & W monitor (Model: SM124)
laser printer 300 x 300 DPI (Model: SLM 804)

Software:
All system software
Neodesk 2.0
LDW power spreadsheet
The timeworks desktop publisher ST
All manuals & original disks

How much would be a fair asking price. This system IS NOT FOR SALE TO THE PUBLIC YET. People at the university have to have first crack at it.

Please write me with price estimates as soon as possible
Thanks in advance

7194. Amberstar Puzzles Again

Newsgroup: comp.sys.atari.st
Date: 1993-05-19 13:16:23 UTC
From: rrk@vixen.cc.bellcore.com
Message-ID: <1993May19.131623.7089@porthos.cc.bellcore.com>
Source record: 205720

Well my wife is stumped again, so she came to me, and now
I'm stumped again too. In Amberstar, she has reached a
"Snake Island" which is surrounded by mountains, and she
cannot get through even though she has the sphere of opening.
Any suggestions?

In a different path, the Riddlemouth wants a word for the
opening. Our answers have ranged from "portal" to "debut."
It doesn't like any of our answers.

Since I see many puzzles ahead for us, does anyone know if
a hint book exists for Amberstar? This is apparently a very
addictive game, by the way.

AG> the Tina Turner and Paragon2 demos.
AG>

Ok, me and some other lucky bastards (ie. falcon owners) upload everything
we get to ftp.uni-kl.de in germany. Both the files above are there, and a few
others as well. They rarely make it to a.a because of a couple of things:

1) I can never get into a.a these days, always too many users.
2) Files moves so slowly from New to Newitems
3) Transfer speeds aren't what they used to be either..

So if someone with a fast link to uni-kl and a.a could move the files over
that would be to the benefit of all I guess.

Now getting files from GENIE to Internet has never been easy and probably
never will but there is one thing that is even worse: getting files from
Australia the same year they are released :) Good luck!

Cheers,
Torbjoern Ose - tose@brosme.dhmolde.no

It is indeed a stand-alone. It is quite powerful (and I gather there
is now a new, fancier version); but look also at Didot Lineart, which
I much prefer.

OK. I'm in the process of FTPing the falcon-related files from uni-kl (thanks to multi-tasking and multi-processing ... I have a UNIX box on my right which is doing the transfers at this moment.)

Expect to see them on atari.archive.umich.edu no later than 20 May 1993.

Tell that to the computer people at our school who have MacX running on
just about every single Mac on campus. They're all hooked up to the
Internet somehow so you can log in with MacX just like you're on an
X-term. These aren't Quadras either, they're 2-3 year old Mac II
machines (like cx, si, ci -- I get confused with all the different
kinds), and the performance really isn't too bad. Oh, and the screen
resolution : 640x480.

That means Atari is finaly joining the SCSI and CD-ROM market.
That's a little different then 'bringing CD-ROM to the users desk' as
suggested in the original posting. Atari is just jumping on the
bandwagon.

How about Montezuma's Revenge or Phantom of the Asteroid from the C-64?

BTW If there are any Bards Tale fans out there who played it on the C-64
but do not have it on your ST, this might be of interest. I have The
original Bards Tale running on my ST; it is a 300k+ file uncompacted.
It is exactly the same as the original!

Well, since Linux definitely needs memory protection (read a PMMU, so a
68030 in our case) it will only run on a TT or Falcon030 and probably needs
8Mb RAM minimum.

The DSP in the falcon does not have enough balls to do a lot of voices with a lot of control over them. I would estimate that you could get 6 to 8 voices with simple attack,decay,sustain and release control over amplitude, harshness (frequency spectrum) and possibly center frequency. It most likely will have enough CPU horesepower to do on DX-7 voice.

Ted.

P.S. You also need to find code or write it to do it. I wrote some for a TMS320C30 DSP I have connected to my Atari that I can do 5 voices on. The code is not turned for performance very well but does respond to MIDI commands.

I'm finally in a position to consider getting more RAM for my 2 meg TT.
Of course, I would prefer to get only fast TT RAM, except that Spectre 3.0
doesn't recognize it. So I might algo get a couple more megs of ST RAM....
unless someone tells me that 3.1 is coming soon (I hope...). Whatever is
happening with all the beta testers? Is the thing working? Is there any
hope of it being out in the next few weeks (months in Atari time)? Is there
any word from Dave Small?

Source record: 205748

I just read that Atari has acquired a license to use Supermac Technology's Cinepak video compression technology (used by Apple for System 7 Quicktime multimedia extensions) in one of its upcoming products. Unfortunately, no mention was made on which product it was to be used for.

It certainly is nice to hear good news about Atari outside of this newsgroup, though!

-Steve

In the sense that you _can_ import CVG format files into Pagestream,
Invision Elite etc. or change the CVG into an Illustrator EPS it is stand
alone... however you cannot print from Outline Art. I have Outline Art 3.0
with color and it is wonderful!!!

[Article crossposted from comp.binaries.atari.st,comp.sys.atari.st]
[Author was Steven Grimm]
[Posted on 3 Apr 1993 11:10:08 -0800]

Submitted-by: koreth@spud.Hyperion.COM (Steven Grimm)
Posting-number: Volume 19, Info 1
Archive-name: Intro

[Note: as of volume 19, the structure of the articles will change slightly,
to bring comp.binaries.atari.st more in line with other moderated software
groups.]

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@spud.Hyperion.COM

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@spud.Hyperion.COM. If you are on a UUCP-only site, you
can send them to uunet!spud.hyperion.com!atari-binaries. Note that
comp.binaries.atari.st is not the correct place to ask general questions
or to ask, "Does anyone have software that does X?" Post such requests to
comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, say so at the beginning of your
submission, or in a cover note. I try to verify that a program works,
and if I can't get it to work, I may hold up posting it for a couple of
days. Please note that, except in rare cases, software without
documentation will not be published. The backlog from receipt to posting
varies from one to four weeks depending mostly on the set of submissions
currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. (The comp.sources.atari.st address is atari-sources@hyperion.com.)
If I have to separate your sources from your binaries by hand, your
submission will most likely sit on the back burner for a while, or be
rejected outright.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. I don't write the descriptions at the tops of the articles; what you see is what the submitters gave me. If your program only runs in one resolution, or requires a certain amount of memory, please say so; I can't test it in every possible configuration to see what works and what doesn't. If a submission arrives without a description, it is likely to be rejected.

The preferred packing method is Zoo 2.1 with high-compression mode (the "h" flag) turned on. I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this means arc, zoo (preferably 2.1), and some versions of lharc, though that's risky. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages. LHarc submissions may be rejected if I can't figure out which version of lharc I need to use to unpack them.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful to the users on the net, which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v19INF2: Index of previously-published binaries

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v19i081: deadwrtr -- Ouija-word processor part01/01

identifies this as the 81st binary article in Volume 19. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v19i041: zx81 -- Timex/Sinclair emulator part04/39

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, tin, etc.) which can follow threads

will recognize a large program as a single thread.

The first few lines of an article's body are auxiliary headers that look like this:

```
Submitted-by: jackt@atari.com (Jack Tramiel)
Environment: uue, zoo-high, high, tt
Posting-number: Volume 19, Issue 80
Archive-name: rsn
Supersedes: atw: Volume 10, Issue 10-15
```

"Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site. This will usually be the same as the "From:" line in the article's main header.

Certain information about the system configuration required to use the program is given on the Environment: line.

```
Environment: uuencode, 1meg, medium, high
```

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

```
uue - program is uuencoded (Dumas "uud" required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
zoo-high - program is a zoo 2.1 high-compression archive (zoo21 req'd)
lharc - program is an lharc archive (lharc required to unpack)
high - runs in high resolution (monochrome)
medium - runs in medium resolution
low - runs in low resolution
1meg - needs 1 meg of RAM
ste - requires an STe
tt - requires a TT
```

The Posting-number line repeats the volume/issue information for the aid of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

The Supersedes header line, if present, indicates that the program replaces an earlier version. This is mainly for use by automatic archiving software.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-by header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

Sory Mike but from what I have seen of the Price for Didot, its not for the home user, its a real Professional program, and from the feed back that has come back to me Outline Art is not a stand alone program, plus you do realy need a TT and lots of Ram to run it, again still not a Home user program..

What I am after is a Program to replace the Bug ridden Pagestream 2.2, but I only need it for flyers etc...

Is there nothing out there for the Home user..??

Well, the Comeau C++ 3.0 With Templates beta, although belated, is currently
in quite a stable state, and what is left is a bunch of nitpicks and loose ends
so another choice will be available soon. We won't use 1M either, but
won't use as much as GNU.

> So, it seems to me I should be able to compile a GNU C cross compiler for

Parts of that looks like it will work from what I understand you to
say, but I don't think the full scheme will.

It is a problem of the programmer ;-) The issue is that what you have above only establishes a static member declaration, a definition is still needed. A definition would look like so:

int Test::var = <someinitvalue>;

Further, please note that this DOES NOT (from a stylistic viewpoint) go into a header file (actually it goes beyond style because if you used the respective header twice it would end up violating the ``one definition rule''.

7232. MiNTbash Help Please

Newsgroup: comp.sys.atari.st
Date: 1993-05-19 23:40:26 UTC
From: scotty@verdix.com
Message-ID: <1993May19.234026.20790@verdix.com>
Source record: 205561

I was using the Korn Shell (in spite of its weaknesses) in TOSWIN with MiNT 0.95, but I find that 'ls' doesn't work anymore when I use it under MiNT 1.04. For this reason, I decided to download mintbash from a.a.u.e. and give 'er a try.

While for the most part it looks very promising, I've run into some problems that are making things difficult:

o Setting the prompt: the documentation refers to a function called decode_prompt_string() and lists parameters for it. mintbash doesn't recognize this function. Is it a builtin, or do I need to acquire it from somewhere?

o Using define or typeset to set the prompt to the current path, (ie. define PS1='[$PWD] '), works incorrectly. Instead of replacing the value of PS1 with the new path, the new path is concatenated! This results in a prompt which looks like
[c:/mint_104e:/gnu/bine:/work/dev]
and keeps getting longer. The point is, $PS1 isn't being updated properly. I'm using a standard GEMDOS "8.3" filesystem; could mintbash be minix fs only?

o I can't get line editing to work. I'm using 'set editing-mode vi' at present. In KSH this is supposed to start happening when one types the escape key. It doesn't. Of course, this command is supposed to go in one's .inputrc file, and mintbash doesn't seem to have an equivalent file on the ST. I put the command in my bash.rc file.

o I'd love to RTFM to solve this. If anyone knows where there's an M, point the way! ;-)

Thanks for any help! If there's interest I'll post a summary of replies.

All I need to say is : ARCHON! ARCHON! ARCHON! ARCHON! ARCHON! ARCHON!

As I remember the good ol' 8-bit days, both of the Atari 8-bit and
the C-64, the most fun two-player game in the world was ARCHON. There were
other games but eventually they lost their flavor. ARCHON never did and it
was always an exciting and enjoyable game. It had both strategy (seeing what
creature is best for what and trying to gain certain positions on the board)
and a test of reflexes and reactions (the combat portion of the game). There
are other similar games such as Street Fighter II and StarCon II, but we
will never see very playable versions on the Atari ST. Also, they don't have
the playability that ARCHON has (I played StarCon II, which is extremely
similar except it was a battle in spaceships, and it just wasn't a game
of quick reflexes and actions...there were few obstacles and the balance
just wasn't there). Archon was ported to the Amiga and the Macintosh by EA and
I think that there should be a version for the ST.

Under TOS if you try to access "c:" vice "C:" (note case difference) you are
trying to talk to the (c)artridge port vice a floppy or hard disk drive.
Perhaps this is your problem.

7237. WANTED: looking for Music Layout Program

Newsgroup: comp.sys.atari.st
Date: 1993-05-20 02:02:32 UTC
From: maheal@hawk.adied.oz.au
Message-ID: <maheal.737863352@hawk>
Source record: 205572

I am looking for information about the following program:

Program Name : ScoreST
Program Author : Phil Comeau
Copyright Date : 1990
Distributed By : Antic Publishing

I have seen this program running and I am interested to know where can I get a copy from. Or, has the Author produced an updated version of this program.

The program is a _Desktop Music Layout Program_ that runs on the ST.

If anyone knows of any programs that do similiar things to the above program, or know of any programs that will allow me to develope music scores that are a mixture of music and text (i.e. similiar to that presented in your average music book), then I would be interested to know where I can get them.

Thanks in advance,

Martin Heal (maheal@hawk.adied.oz.au).

7238. Speed of Light Version 2.5 on a.a.u.e!

Newsgroup: comp.sys.atari.st
Date: 1993-05-20 02:12:29 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1tepedINNdn9@news.u.washington.edu>
Source record: 205565

I'd like to announce the release of an intermediate version of Speed of Light GIF viewer for all ST/E/MEGA/TT/Falcon (all Ataris!) computers! It can be found at the FTP site atari.archive.umich.edu.

This version fixes most of the bugs that version 2.1 had and is almost exactly the same as far as its features, with the following changes:

-- The program now works in TT fast Ram.
-- Uncompression, color reduction, screen drawing, and a lot of other features have been radically improved, for even greater SPEED!
-- The program now loads all GIF formats including commented GIFs and 89a. It will even load GIFs with garbage at the beginning of the file (some get corrupted!)
-- The program allows you to save low rez screens as a PI1 picture. (This is just a quick hack, don't get too excited!)
-- Memory is handled a lot cleaner for compatability with more resident programs and accessories.
-- Many other bugs have been fixed.

NOTE: Version 3.0 is about half way finished and version 2.5 was just released as an intermediate version to show users that I'm still with you!

VERSION 3.0 SCREEN SHOTS ARE INCLUDED WITH THE PROGRAM TO GIVE YOU A TASTE OF SOME OF THE STUNNING NEW FEATURES!

Please THOROUGHLY read the README.1ST file for more information and changes.

If anyone does not have FTP access to atari.archive.umich.edu, please Email me and I can send you a uuencoded version of the file.

Thanks for your support and Enjoy the program...

Huh?

I've used an atari CD-ROM drive.
It's currently sitting on the local Atari club's BBS.

"Real soon now"? More like - "Been there, done that, no-one bought them"

Hi there.

I'm eventually going to be moving from the Edmonton to the
Ottawa area, and I was wondering if there were any stores dealing
in Atari merchandise and whether they service Atari machines.

I have an Atari 520STfm, and was planning on either upgrading
the memory, buying a 1040, or buying a Falcon, and I need to decide
if I should do the upgrading now or later. (If there are no Atari
specific stores in Ottawa, I'll have to do the upgrade here.)

>find such softwares)

Definately GnuC (you need lots of memory though!)
or Sozobon C (heat N serve)
Both are at atari.archive.umich.edu

> _ with this, can I easily use windows and mouse as I do with GFA?
Never used GFA, but there is of course 100% support for all the windows
mice, etc. etc. just get a good library and gemfast.h

> _ and above all : is it possible to control the MIDI ?
Midiws(), Bconout(3,ch), ch=Bconin(3);
(Midi protocols are up to you of course, since thats an 'external' standard)

> _ where can I find C sources for ST?
same site as above, as well as comp.sources.atari.st

Since C is portable(moreso than GFA), the internet is the best place to
get C code in general

Source record: 205575

It appears that there is a serious bug in the low-memory reduction and/or sectioning part of the program. I will try to fix this by the weekend and have a new version of 2.5 out. If you use this feature a lot then the program might not work for you. Thanks for understanding. Machines that need this low memory feature can use 2.1 for the time beeing.

To bad...I just got new Mac prices that will increase the install base of Mac CDROM systems. A mac Centris 610 4/80 is $1217 educational and $1449 street, the 8/230/cdrom is $1979. The Mac IIVX 5/80/cd is $1783 about what the Falcon 14/65 costs. The Mac LCII 4/80 is $799 educational and $1049 list(don't know what the street is).

Anyone know the street price of the Fa lcon is???

The are all already availible via FTP. :) Just connect to
ftp.uni-kl.de. That is where every new demo GEnie eventually
gets comes from... As far as I know, it's the first place in the world
to receive most demos, as many of the demo coding teams send the files
there directly. atari.archive should just mirroe their demo
directory. :)

The ones you mentioned are, of course, there.

I second that ARCHON request! I really enjoyed playing that game when I was young on a friend's C64. If you decide on this one though I would hope you would keep it two player since that is actually what I enjoyed about it.

Another great game from the 8-bit world is Seven Cities of Gold. My friends and I played it almost every weekend on a 130XE. I have often considered picking one up for that game alone. Hope to see a great game from you soon, I would surely send shareware fees for both the games mentioned here.

Hi!

Blatent plug time, sorry!

Jeff has just put onto atari.archive the new version of my DeskTracker program,
in /Ste/dtmt.lzh.

ASTRAsoft DeskTracker MT
========================
for the Atari ST

Release s1.03

DTMT is an AUTO program / ACCessory combination which will play most
types of NoiseTracker and ProTracker MOD files with an interactive
control panel and associated visual windows (oscilloscope and Frequency
patterns).

Compatible with Atari ST, Atari TT, Atari Falcon (with patch program, not
provided) and MultiTOS (with memory protection turned off!) with any
version of TOS and (hopefully) any screen resolution.

David Oakley, ASTRAsoft
18th May 1993

PS: Registered version available v.soon now... Copes with Amiga MED files too!
After my exams I'll be tackling OctaMED!

>Sory Mike but from what I have seen of the Price for Didot, its not for the
>home user, its a real Professional program, and from the feed back that
>has come back to me Outline Art is not a stand alone program, plus you do realy
>need a TT and lots of Ram to run it, again still not a Home user program..

I don't know the price for Didot LineArt, because my copy, sort of, erm, fell
off eh... the back of a truck, but it definitely runs on an ST. I have an
1040ST with 3Mb RAM and I have never encountered memory problems. It can
render PostScript output, which OutlineArt can not. It does have a (very bad)
tracer and a very good fonteditor/converter. Now you can read PostScript Type1
fonts and convert them to Calamus CFN format.

Well, the subject pretty much says it all. I would like to get some online games for my friend's BBS. He is running Turbo Board. He can run Forum compatable games. He currently have DDST, Galatic empire, SEE, Assassin, Air Raid. He is also interested in getting utilities for it and would like info on Fnet.

Email info or games to me and I will give them to him. Seems that the support BBS for Turbo Board is going down/out of business. This is why I beg to the net.
Anyways. email replies to storm@netsys.com

P.S. If anyone is interested in calling... number is 503-753-3023 24 hours a day. You get full access first call.

7257. Modem questions

Newsgroup: comp.sys.atari.st
Date: 1993-05-20 11:54:48 UTC
From: gijs@mbase97.hacktic.nl
Message-ID: <H.eg.hvTXVBCeWGw@mbase97.hacktic.nl>
Source record: 205454

Hi,

I recently replaced a 1200 baud with a 9600 baud modem. This gives me
some problems:

1. When dialing BBSs, some characters get lost, but only sometimes.
I use Flash, and the Atari vt52 acc. RTS/CTS on or off doesn't matter.
I use Serialfix 1.1. This is a very irritating phenomenon.

2. I tried LAPM/V42bis on a UUCP connection. This gives me lots of errors,
and UUCICO can't seem to correct it. Without LAPM/V42bis everything
works fine. This doesn't worry me so much, but I'd like to know
what's going on.

The strange thing is that Zmodem downloading with XYZ works flawlessly.

The computer is an Atari 520ST+, TOS 1.0.
The modem is a Tricom Tornado Quin.

If anybody has a clue, please followup or mail!

Another question:
Does anybody know of an ANSI terminal emulator that uses Atari's
monochrome monitor?

Thanks in advance,

I know there was definitely one for the 8-bit systems - and from
what I remember it was a very good version as well (graphically and
musically).

I never got around to searching for games for the 16bit, so I dunno
about that.

On that subject - was there a Dig Dug for the ST, and if so, how
faithful was it to the original?...

Hi Erik,

yes I do have a copy of Didot Line Art, but I think its a Demo version,
there is no printer option from what I can see of it, can yours print..??

Another good German program is LavaDraw Plus, can do a lot of thing with Text,
no big fonts from what I can find out, 3D mode and Stars with any number of
pionts, shadow text and yoy rtell it were the show will be, etc..

German software I find is good, but can't read German much..

Is there any other good programs that you know off..??

Bye for now...

Yes, Markus Gutschkes excellent Falcon HiRes driver (900*768*4bit) uses these registers to full effect, giving a competitive HiRes mode to a Falcon without extra hardware, which works fine for all falcon software....WHY did Atari not include this GFX mode as standard from the desktop??? The hardware can do it...

My hard disk died. I would have liked to run something analogous
to the PC Norton utilities over it to find the problem and maybe fix
it. However, ALL the diskedit/recovery programs that I have looked
at are brain damaged and will not handle sector sizes other than
512. None of the dealers I have spoken to know of anything suitable
(there are very few serious Atari dealers in this country).

Does anyone out there have a solution - it does not have to be free,
but inexpensive would be nice.

7276. RDE_V3 - Version 3 of the RDE/RDY ramdisk sent to a.a.

Newsgroup: comp.sys.atari.st
Date: 1993-05-20 18:36:17 UTC
From: wabe@ukc.ac.uk
Message-ID: <4370@eagle.ukc.ac.uk>
Source record: 205461

Saveable-with-Contents-to File, RDY, Mark Williams Co.

I have just downloaded Version_3 of RDE to atari.archive@umich
where you can find it at ~New/rde_v3.uue until Mr. Weiner et al move
it elsewhere (presumably to atari/Utilities). It has also been sent to
the archive hensa@uk.ac.hensa.micros and should soon be available there.

Brief Description:
~~~~~~~~~~~~~~~~~~
Version_3 of RDE, the reset survivable, configurable and
(uniquely?) saveable-with-contents to file ramdisk, started life as
Mark Williams Co.'s RDY ramdisk utility bundled with their C compiler.
Since MWC left the ST-scene, I have, by kind permission of Mark Williams
Co., been upgrading this to cater for the latest TOS changes etc. e.g.
RDE Version_2 (in the archives since March 1992) is an "All TOS"
compatible version that works on ALL ST's and, I think, also on the TT
and Falcon (though I have not been able to check this - Please let me know
you Falconers and TT'ers). Now I've added some further upgrades the most
important of which is the removal of a "bug" that limited the maximum
size of ramdisk to < 2036 kbytes or so.

RDE_V3 supports virtually unlimited sized ramdisks - and as such
should be useful to Falcon and TT users that have a lot of RAM (up to
32 Mbytes is possible I believe). Several other minor improvements have
been made as explained in the documentation. Some (essential) accessories
are included - including a sector copier, DFT.TOS, and DESKTOP.TOS so
that one can load DESKTOP.INF files from a "booting" RDE ramdisk to drive
C:\ (if it exists) where TOSes (>= 1.04) will look for them. This is
upgraded (slightly) to cater for the new TOS 2.06 (3.06 on TT).

Sincerely, W. Alan B. Evans
[wabe@ukc.ac.uk]

Yes CoNnect - but you probably won't get happy with modern programs
running on TOS 1.0... Ths should be your first upgrade...

7279. RDE_V3 - Version 3 of the RDE/RDY ramdisk sent to a.a.

Newsgroup: comp.sys.atari.st
Date: 1993-05-20 19:42:53 UTC
From: wabe@ukc.ac.uk
Message-ID: <4372@eagle.ukc.ac.uk>
Source record: 205464

Saveable-with-Contents-to File, Mark Williams Co.

I have just downloaded Version_3 of RDE to atari.archive@umich
where you can find it at ~New/rde_v3.uue until Mr. Weiner et al move
it elsewhere (presumably to atari/Utilities). It has also been sent to
the archive hensa@uk.ac.hensa.micros and should soon be available there.

Brief Description:
~~~~~~~~~~~~~~~~~~
Version_3 of RDE, the reset survivable, configurable and
(uniquely?) saveable-with-contents to file ramdisk, started life as
Mark Williams Co.'s RDY ramdisk utility bundled with their C compiler.
Since MWC left the ST-scene, I have, by kind permission of Mark Williams
Co., been upgrading this to cater for the latest TOS changes etc. e.g.
RDE Version_2 (in the archives since March 1992) is an "All TOS"
compatible version that works on ALL ST's and, I think, also on the TT
and Falcon (though I have not been able to check this - Please let me know
you Falconers and TT'ers). Now I've added some further upgrades the most
important of which is the removal of a "bug" that limited the maximum
size of ramdisk to < 2036 kbytes or so. RDE_V3 is fully compatible with
ramdisks and saved-ramdisk-files made with RDE_V2 and indeed RDE_V1.

RDE_V3 supports virtually unlimited sized ramdisks - and as such
should be useful to Falcon and TT users that have a lot of RAM (up to
32 Mbytes is possible I believe). Several other minor improvements have
been made as explained in the documentation. Some (essential) accessories
are included - including a sector copier, DFT.TOS, and DESKTOP.TOS so
that one can copy DESKTOP.INF (or NEWDESK.INF for TOS 2.06) files from
a "booting" RDE ramdisk to C:\DESKTOP.INF (or C:\NEWDESK.INF TOS_2.06)
where, provided drive C:\ (hard disk usually) exists, TOSes (>= 1.04)
will insist on looking for them - otherwise the desktop on the "booting"
ramdisk drive is used automatically. If those without a hard disk wish to
see how this works - just load a non-booting Ramdisk C:\ in addition to
your booting Ramdisk and TOS will treat this just like a hard-drive C:\.

Sincerely, W. Alan B. Evans

>[deletions]

Actually, we tried this one already. We called it "Beetle Battle" :)
We got to the stage of having a scrolling, 3D city, but we lost interest
in optimizing to code to speed it up enough to be useful.

Thanks to all the people who responded... We got lots of replies. We are
still open to suggestions, though. I'll summarize sometime next week.

BTW, does anyone know about the legality of doing this? (That is,
copying the concept and plot (and maybe the graphics, to a certain extent)
of an old 8-bit game). The game will be PD, so we won't make any money out
of it. Of course, we won't be using any of the original code, but could
we be done for "look and feel" ?

My guess for snake island is to get that Amazing Flying Machine out of the cave in the Western Desert and just fly over those mountains.

Which riddlemouth wants the word?

I don't know of any hint book. A manual that was more than (badly) transliterated from the original German might be a bit of a help, though. For example, it took me a while to figure out "parade" meant "marching order".

I have a TT which will soon have 20 megs of RAM. Can I run X-Windows
under Linux? If I run Linux, do I forfeit my ability to run TOS and GEM
programs? If not, is it concievable that they could be run in windows on
X-windows? If I compiled hello.c under Linux, could I take the binary and
run it on a non-linux machine (i.e., a 520 or something)? If I compiled a
GEM program under Linux, could I do the same thing?

This message is posted on behalf of a friend who has no Internet access yet, but can be contacted via email.

He is planning to emigrate to Sydney, Australia towards the end of this year and would like any information about the Atari situation in Oz. He has just returned from a 7 week visit and has found the Amiga to be the most popular games and recreational machine. Does Atari have much of a share in any marketplace particularly the music industry. Also he would like to make contact with other Atari users. He is a specialist in Data Recovery from all types of hardware and systems particularly Akai and Roland samplers, as well as DOS, OS32 MT (CCC), Atari etc.

Please answer by email to - Eric,

Hi,

I have heard many times about the 'Screen Blaster' for the Falcon.
Exactly what resolutions can it handle with and without hardware ? How many colours are offered in these resolutions, and how fast does the machine run these
modes ? In adittion, is a Multisync monitor or just a Super VGA monitor
required ?

Thanks

7289. Re: Cross compiling with GNU C for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-05-21 01:17:01 UTC
From: warwick@cs.uq.oz.au
Message-ID: <13501@uqcspe.cs.uq.oz.au>
Source record: 205474

comeau@csanta.attmail.com (Greg Comeau) writes:

>warwick@cs.uq.oz.au writes:
>>You could just use my GEM++ C++ class library (written in GNU C++ of course).

>I'd be interested in hearing more about this, and AMS.

Greg may have intended to email, but I think this is worth posting anyway.

I am a strong believer in sharing code. And I think C++ is THE language for
doing it. The reasons are:

1. It is as popular as C (or at least, it shortly will be).
- You need a userbase in order to share code
2. It has a high level of information hiding - encapulation.
- You need this, or else chaos eats you up.

Now, it seems to me that there are three types of applications written for the
Atari computers:

1. Machine independent (eg. all the ported GNU tools)
2. GEM dependent (all those nice apps that run on all screen sizes)
3. Machine specific (they run in only one or two fixed resolutions)

For (1), you can use all the world's class libraries.

For (2), I wrote GEM++.
For (3), I wrote AMS.

>Any chance of giving a "mild" example, maybe a screens-worth [of GEM++]?

Here is some example code I just made up:

```
------------------------------------------------------------------------

main()
{
// Before we do ANYTHING with GEM, we must declare a GEMapplication.
// This does the old appl_init/appl_exit stuff for us.
GEMapplication example;

// Create some GEMrsc objects (they load RSC files)...
GEMrsc rsc1("example.rsc",8,16);
GEMrsc rsc2("exam2.rsc",8,16);

// Create some GEMform objects from those GEMrsc objects
// by simply using the RSC indices that we used in the
// RSC editor.
GEMform form1(rsc1,FORM1_RSC_INDEX);
```

```
GEMform form2(rsc2,SOME_OTHER_INDEX);

// We can make a complete COPY of a form very easily...
// This copies all the user-modifiable parts of the form,
// but can just share the original copies of constant things
// like titles strings, etc.
GEMform anotherform=form1;

// To use forms, we just "Do" them... [ SEE NOTE 1 ]
form1.Do(); // (centred)
form1.Do(100,30); // (at a given position)

// If we declare GEMobject objects :) in the GEMform, we
// can find out more via those GEMobjects. Again, we simply
// use the RSC indices to refer to objects...
GEMobject the_okay_button(form1,OKAY_BUTTON);

if (the_okay_button.Selected()) {
printf("OKAY selected\n");
}

// More interesting than GEMforms, are GEMformwindows, which
// are just like GEM forms, except they are in a window.
//
// To use GEMformwindows, we need a GEMactivity in which the
// windows act. This encapsulates all the event handling
// code, and all those ugly low-level things that C GEM users
// had to deal with.
GEMactivity activity;

// Then, all we do to have a window is say which GEMactivity
// it is in, and get the graphics out of a GEMrsc.
GEMformwindow my_window(activity,rsc1,MY_WINDOW_INDEX);

// Open the window... [ SEE NOTE 2 ]
my_window.Open();

// And set it all in motion... [ SEE NOTE 3 ]
activity.Do();
}

NOTES:
1. Normally, the user will create a derived class of GEMform
that encapsulates the actions that need to happen when
the user interacts with a form. This is done by overriding
the virtual method "DoItem(int item, const GEMevent& e)",
or by declaring actuve GEMobjects in the form. But here,
for simplicity, I have shown GEMforms being used directly.
2. Cleverly, GEM++ only calls the GEM "wind_create" funtion
when a window is actually opened. This way, you can have
any number of "GEMwindows" (of which GEMformwindow is one type)
and only the OPEN ones will take up GEM window handles.
(which are limited in some TOS versions)
```

3. Normally, the user will have other things like a GEMmenu
object, maybe a GEMdesktop [though not advisable under
MultiTOS!], other windows, etc. in the activity.

>Do you use any of the g++ extensions/incompatibilities?
>I ask this as I'd imagine that if it didn't, that it would
>probably mesh with Comeau C++ 3.0 With Templates reasonably.

I have tried to avoid any dependence on GNU C++, but only having one
compiler to check against, I guess some minor dependencies may exist
(ie. bugs in my code that G++ lets slide).

Source record: 205475

Perl, which is a comparatively similar job control/scripting language, has been ported to the ST. This is fairly easy in that sources are readily available in C via GNU-Copyleft.

I haven't seen any "Public-Domain-equivalent" sources for REXX; in most cases, implementations are commercially developed. There's one exception; I've got an IBM-PC version of REXX that was released as freeware. It's definitely 80x86 specific, and sources weren't available.

I'd suggest that people take a look at Perl instead. It does very similar things.

>File not found..

:)

Actually, two bombs means "Bus error". It may mean in your case though
that a file is indeed missing, and the program is not checking the
returned FILE* - just using it blindly. In the file is not found,
the FILE* will be 0, and hence a Bus Error will be signalled if they
still try to use it.

>BTW, does anyone know about the legality of doing this? (That is,
>copying the concept and plot (and maybe the graphics, to a certain extent)
>of an old 8-bit game).

Yes, and the conclusion, in a word, is DON'T DO IT. By cloning someone else's game, you are asking for legal trouble. The holder of the copyright can make a case that you have cost them money in lost sales. If they are a US company and have registered their product with the US copyright registry, they will be entitled to treble damages. The Berne international copyright convention, which most 1st world countries adhere to, specifies similar terms.

As much as those great old games seem to beg to be ported, don't take the risk. Contact the holder of the rights for the Atari, and make sure you get written permission from them to do your port. You may find that a little old grandmother in Tulsa holds the rights and is willing to let you do your port for free. (This is a real example, by the way.)

>The game will be PD, so we won't make any money out of it.

This really has no bearing, other than potentially making the judge more sypmathetic to you once you're in court. To show loss of sales, you don't need to say anything about how much the infringer made. In fact, it could be argued that a *free* program costs the copyright holder more in terms of lost sales than something the infringer charged for.

Consider this. Suppose the Bitmap Brothers release their latest game for the ST. It's awesome; clearly a classic of its genre and a masterpiece of coding. Now you and some friends decide you want to see if you can match their tricks. You copy their game concept and use their art, and make a near-perfect clone. Would you release it? Hopefully, it's obvious that you'd be getting yourself in trouble by doing so.

The fact that a game is old doesn't change this scenario. The holder of the rights for your platform is STILL the holder of those rights, and you MUST get permission to do your port to avoid the threat of a suit.

>Of course, we won't be using any of the original code, but could we be
>done for "look and feel" ?

You simply MUST make your game substantially different to be in the clear. In particular, it must APPEAR different to the computer-naive, for it will be that kind of person who will be determining whether or

not you have infringed in court, should it get that far. This means different graphics, different sound effects, etc. at the very least. But really you're just better off writing your own game, perhaps using the classic as a jumping off point. If your game is as different from the classic as Galaxians is from Space Invaders, for example, you're probably OK.

Finally, don't think that people don't come out of the woodwork and enforce their copyrights and trademarks on old games. People have come under fire for ports of Pacman, Tetris, and Scrabble on several platforms, and there are surely more examples. Sometimes it's only a matter of time before someone at the source company stumbles upon your clone.

Be careful -- don't learn this lesson the hard way!

|||The modem is a Tricom Tornado Quin.
++++++++++++++++++++++++++++++++

If you're using a highspeed modem your computer has to 'talk' to the
modem (and back) using the RTS/CTS signals (Request To Send/Clear To
Send) also known as 'hardware handshake'.

The problem with the Atari ST is that it never supports that hardware
handshake correctly, even with TOS 2.06 you need some patches. However,
if you put one of the patches (like RS232EN.PRG) in your AUTO-folder,
things are working pretty nice. I don't know if the patches will work
with your 'stone age TOS'.

Linux does quite well on a 4 meg pc, and is even (relatively)
usable with 2. However, with X, 8 megs is prefered. You can always use
swap, however.

At this resolution, what's the refresh rate? Also, would higher resolutions be possible in a monochrome (1-bit) mode? I'm thinking 19" monitor here (1024 x 768, or 1280 x 960).

I take it this is just software? No extra hardware involved?

Well, now that you put it that way, I agree with you that it would be
a good thing. If nothing else, it would demonstrate that Atari was
solidly behind CD-ROM, and encourage others to jump on the bandwagon.
But then, I've felt this way since I first saw CDROMs operating on
the Atari back in 1985 at the CES show.

> Atari made some deal with PLI some time back, but I don't know if it's still
> in effect. They were supposed to write 'compatible with Mac, PC bla bla

The deal is still in effect, but I haven't seen any ads recently.

That would be cool.

> >> consider a retailer disc consisting of demos of most Atari
> >> software available. Then all customers out there could try things out and
> >> decide if it's worth their money.
>
> Do you know why the project crashed?

My understanding was that the amount of submissions Atari received
didn't fill enough of a CDROM disk to make it worthwhile. It was
quite a bit of work for developers to prepare, and the demo maker
software was rather buggy. A number of developers weren't confident
enough that Atari would follow through, and so weren't willing to

spend the time.

> I haven't seen your apps, but I'm
> really sad to say that there are a *LOT* of overseas devs who hasn't got a

> 8x11 inches or so) and last but not least, that *have* to have a raster in
> dialogs. I'm exaggerating a bit here, but I think you get my drift.

Thanks for the enumeration of sins. I'll go remove them all right away.
B-)

But this is an interesting topic. When you say "*real* checkboxes",
if you mean squares with X's in them I suspect the reason they're
not used more is because the AES is buggy. I.e., the Checked attri-
bute puts a *white* X in a box (that is, invisible). So most check-
boxes just toggle the selection state (white to black).

When you say "real radiobuttons", if you mean circles with dots in
the center, it's because there's no such animal available in the
AES (you have to create custom objects and animate them yourself).
Plus, you have to do it twice: once for mono rez, once for color.
I've found that many German apps (at least in certain niches),
just don't even bother with color (they're mono only). That cer-
tainly makes things a *great* deal easier. I could design *lots*
better interfaces if I didn't have to accomodate the least common
denominator, i.e., a color screen with only 180-some vertical
pixels available.

I agree with you that there's way too wide a variety of styles for
highlighting titles for dialog boxes. This is an area in which
there were no guidelines available, so unfortunately, everybody
created their own styles.

Speaking of conforming to standards, this is an area where even
Atari can't get it right. Ever since TOS 1.02, they've turned
all/most of their desktop dialog boxes into the alert style.
I.e., two thin lines, instead of the thicker line surrounded
by a thin line. Looks awful.

> BTW, wouldn't it be great with a one week developer camp for Atari
> devs somewhere out there? Come together, share ideas and agree on
> some standards or someting?

This is a great idea. If fact, it may have already been done once.
I know it was scheduled at least twice (before I signed up as a
dev, I think). However, unless Atari financed it, I'm afraid it
would be too expensive for many devs to attend. I know I couldn't
afford it.

But if you want to share ideas and agree on standards, there's a lot easier and cheaper way to do so. The private, developer-only conference on GEnie provides a convenient forum, and I've even seen user-interface issues (e.g. menu hot-keys) discussed from time to time.

>
>Thanks
>

As far as I know there are two separate products:

FalconScreen is a PD program that currently gives up to 928x704@40Hz in
16 colours and a bit less in monochrome.
ScreenBlaster is probably better because the scan rate is at least 60Hz.
It can run in all video modes and res is up to 880*606. ScreenBlaster is
a commercial product.
You do not need a multisync just an SVGA monitor for both.

>
>Is there nothing out there for the Home user..??

At CeBIT, 3K dumped the prices on the Didot package - it is now DM595 for the b/w version and DM995 for the colour version. This is a bundle that consists of Didot Lineart and Retouche Pro. The colour package of course includes the "CD" versions of the two packages. As I see it, they are lowering their prices since the developers left and formed H3 or Digital Arts or something. The new company are offering DA's Vector (and soon DA's Picture). Great app, cheap as well (DM 295 SRP, DM250 street - coming to the US soon) but not yet 100% MTOS friendly as far as I know.

For the home user - well you *could* still use EasyDraw with Speedo or some of the other GEM orientated drawing progs out there. X-Act Draw from germany for instance. That one will probably work just fine for flyers. More apps that tap into the power of the new GDOS will surely appear soon.

But pleeeeeease, dump that Pagestream shit *NOW* :-)

:In article <1993May20.194329.26506@cc.ic.ac.uk> rm03@ic.ac.uk (Mr R. Mellish)
:>BTW, does anyone know about the legality of doing this? (That is,
:>copying the concept and plot (and maybe the graphics, to a certain extent)
:>of an old 8-bit game).
:
:Yes, and the conclusion, in a word, is DON'T DO IT. By cloning someone
:else's game, you are asking for legal trouble. The holder of the
:copyright can make a case that you have cost them money in lost sales.
:If they are a US company and have registered their product with the US
:copyright registry, they will be entitled to treble damages. The Berne
:international copyright convention, which most 1st world countries
:adhere to, specifies similar terms.

Dave, I think you may have over-estimated the influence of international agreements, and may also have forgotten that UK court cases are nowhere near comparible with USA super-sueings.

Also, as I understand it, the lads are not talking about wholesale carbon-copying a game, merely "look and feel" gameplay and style.

Damages? Paid from what? Non-profit making students (who probably have enough trouble paying their rent every week) don't have much money from which to take damages. Prison is NOT an option. The UK (congratulations, by the way, for noticing that this was a NON-USA question) does NOT have a tradition of fining people what they can't afford, whatever the international agreement.

The Berne Convention certainly sets down some guidelines. However, in the UK, there has never been such an action (foreign rulings do not count), so any case would also be a LEGAL PRECEDENCE, in addition to being financially non-productive.

Action would only be taken if:
1) The person, company or whoever bought out the copyright were still in existance (unlikely) and
2) They were prepared to set a legal precedence in UK law (expensive) and
3) They just wanted the game removed from the market (not fiscal compensation)

Since you are not making a profit, and the company whose game you are adapting/ripping off (delete as applicable) is most probably defunct (perhaps a good idea to choose a game whose copyright owner is KNOWN to be defunct?!?), and the action would be very expensive (and yeild LITTLE return- you're penniless students making no profit, so you have no money which they can claim from you) you're quite, quite safe.

Illegal? Debatable. Immoral? Perhaps. Likely to result in prosecution? NO!
Slightest posibility of being financially sued? Absolutely not!

Even if legal action were to ensue, you'd most likely only be asked to
withdraw the game from any PD libraries/archives you posted it to. You made
no profit and as students are unlikely to have any savings, so the courts have
nothing from which to fine you.

I suggest you'd be totally safe to copy the "look and feel" from a game,
but NOT characters or desgins. Your game would then be a (whatever)-STYLE
game rather than a (whatever)-CLONE game. This way even unprofitable legal
precedence actions would be on exceptionally shaky ground.

I AM NOT SAYING THIS IS MORALLY RIGHT. I am saying what they intend to do
is not likely to result in legal prosecution in the UK.

I welcome further comments from those with knowledge of UK law. If you
have little knowlegde of UK law, then your comments will be of no relevence,
no matter what internation conventions you cite. Sorry.

>include this GFX mode as standard from the desktop??? The hardware can do it...

Oh, the reason is very likely that Atari doesn't want complete newbies
come to the store saying "All I did was choosing 900*768*16colors mode
and now my monitor is broken". Some monitors can't handle this and will
be damaged. One of the monitors that could be damaged is Atari's own
PTC 14something VGA monitor. At least according to specifications. So
it was just some appropriate measure to prevent damage.

Erlend.

I once had Great Giana Sisters for the ST...

But I don't know if it still exists; when I remember correctly, Nintendo bought the idea and then called the game "Super Mario Bros." or some crap like that.

Firstly, will there always BE such things? The atari didn't exist
when most of these games were first published, and secondly,
how do you find out who does have them? In the UK, I mean, seeing
as most Spectrum software was british, and there isn't a copyright
registry here, as far as I know... you publish, and it is copyrighted
because you say so.

>Dave Baggett

Dave - so what did you do with Hacman, then?
I remember reading that Atari asked you about that when you went
to see them with Game Workbench - did you make any arrangments?

Also, all the examples you give, are 'big names' - I know Spears are
very nasty about Scrabble, and Atari are, or least, used to be about
Pacman, Berzerk and all those games [anyone else remember their old
full-page 'Hands Off Pacman' ads?]. Most of these were by one-man
companies, operating out of their homes. I know that strictly speaking,
this make no difference - but I am hoping that because the copyright
holder will be the programmer in this case, rather than the big faceless
corporation, it will make a difference. Heh, we will see.

The games we are looking at *are* those old games, that for some
inexplicable reason were never ported to the ST (or the company went bust).
For instance, Turbo Esprit, on the spectrum was a game with that little extra.
It was a driving game, but instead of 'plod down a track like you're on rails',
it was in a city, with traffic, signals, one way streets, pedestrians, etc...
That game was really nice to play - but it is only available for the spectrum.
It would be very nice on an ST with sound, colour (it was pretty much mono),
and disks. It could also be a nice multi-player game with a MIDI link.

Another one someone mentioned - RDS is similar: I played it off tape
on the c64, and it was a nightmare to load - about 20 minutes before
you play, loading off of 4 different tapes! On an ST, with disks, and a
faster processor/more memory, it would be a lovely game. You could even
MIDI it for more players (original was split-screen). Of course, EA are
still around, and seem to have run into 'US Gold syndrome', so this one
may be hard to do...

I would like to contact the authors, for some of these games, with a view
to getting permission... has anyone else tried this? how hard are these
people to track down? In particular, I am thinking of Ultimate, and

the guy who wrote Skool Daze (Derek Brewster? I don't recall off-hand).

One that made me wonder, was Sinister Developments' Galaxian that
recently appeared... plastered with Bally-Midway logos and copyrights.
Does anyone know if they actually asked Bally or if they are just
'doing the decent thing' and showing the original copyright?

It seems to me that there are a lot of ideas out there that just died
when the only implementation was on a now-dead (not intended as a flame at
speccy and c64 owners - I *know* there are still active communities for
these machines!), and I would like to try and get some of them onto
(relatively) current hardware.

Anyway,
Any information gratefully recieved :)

howie

Message-ID: <737991676.20056@minster.york.ac.uk>
Source record: 205510

Does MultiTOS allow for files to be dragged from a directory window and then dropped into an application? Now that we have a multitasking operating system it seems only obvious that from now on managing files will be taken care of by the desktop and MultiTOS/TOSWIN applications will only have to do the job they are designed for. i.e. no longer the need for each application to have file management menus.

Loading a file will mean dragging a file icon into an application and dropping it there. Copying files will mean going to the desktop and copying the file as you normally would. Renaming a file would use the file manager. Saving a file from an application might even mean dragging an icon out of the application into the file manager?

I assume most people know what I mean and could developers assure me that this is the case.

If someone can send me more details of MultiTOS and TOSWIN I'd appreciate it.

In article <19930521.032842.660@almaden.ibm.com> evilandi@vnet.IBM.COM (Andrew Oakley) writes:
> Dave, I think you may have over-estimated the influence of international >agreements, and may also have forgotten that UK court cases are nowhere near >comparible with USA super-sueings.

Tell Warwick Allison that. He was threatened with legal action by a British company.

> Also, as I understand it, the lads are not talking about wholesale >carbon-copying a game, merely "look and feel" gameplay and style.

They don't want to get in the position of having to make that case in court. Just going to court will cost them a lot of money. It would be much easier to obtain permssion or write something entirely different.

> Damages? Paid from what? Non-profit making students (who probably have >enough trouble paying their rent every week) don't have much money from which >to take damages.

Ah, but there's always personal bankruptcy. If IBM wins a suit against Foobar Inc. and Foobar can't pay, Foobar goes bankrupt, but the company owners are safe from this burden of debt. If an individual owes damages however, there's no such protection.

>Prison is NOT an option.

No, but a lifetime of debt isn't something I'd go looking for.

>The UK (congratulations, by the way, for noticing that this was a >NON-USA question) does NOT have a tradition of fining people what they >can't afford, whatever the international agreement.

So IF the company that you infringe happens to be British, and IF what you say is true, then you're fine to go off infringing on a copyright because all you'll lose is your entire personal fortune? You DO NOT KNOW what would happen in court. And you shouldn't take the risk on the basis of some naive faith in the inerrancy of your legal system vs. that of the United States.

> Since you are not making a profit, and the company whose game you are >adapting/ripping off (delete as applicable) is most probably defunct (perhaps >a good idea to choose a game whose copyright owner is KNOWN to be defunct?!?),

All these "probablies" don't mean dipsquat if you're sued. The fact is that whether or not you make money on your infringing clone is

irrelevant. We're talking about loss of sales here. The mere fact that the clone would be freely available on an international network makes loss of sales easy to establish. You could only counter that by claiming that the game was too old to be profitable in today's market. That would be hard to show, particularly if the free imitation were popular.

Consider Infocom. People had long considered making their games freely available, since the company was "defunct." Had they done so, however, they would have been in serious trouble, because Activision decided to re-release the games later on, and they sold well! In this case, they might very well have lost a lot of sales had someone taken the liberty of making the games freely available. And in this case, where it seems like "little current market value" might be possible to establish, we see that in fact there was tremendous market value -- Activision has sold many tens of thousands of LTOI 1 and 2.

Not only that, but the fact that the authors have gone on an international network saying they intend to clone a classic game makes the infringement even easier to establish. "Gee, the games look the same, AND they have given public notice of intent to infringe!"

>and the action would be very expensive (and yeild LITTLE return- you're
>penniless students making no profit, so you have no money which they can claim
>from you) you're quite, quite safe.

Expensive, yes, for both parties. And, again, the fact that the students don't have the money to cover the damages does not expempt them from paying them. If they've cost a company $200,000 in lost sales, their having no money doesn't change that fact.

> Illegal? Debatable.

No, not debatable at all. If the clone is indeed a clone, it is infringing on the original copyright holder's rights. If the distribution rights for a given platform have been transfered to another party, then the clone may be infringing on both parties' rights. Either way, it's clear-cut from a legal standpoint.

>Immoral? Perhaps.

Totally irrelevant.

>Likely to result in prosecution? NO!
>Slightest posibility of being financially sued? Absolutely not!

Man, do you need to be hauled into court and lose your life savings before you lose your naivete about this? I'm trying to prevent people from learing this lesson in some painful or catastrophic way, and you're practically pushing them off the cliff!

While I admit there's no *guarantee* that you'd even be threatened, such things have happened, even in the United Kingdom, and you are most definitely NOT safe from any kind of action if you clone a game. Why

would anyone want to bring potential financial disaster upon themselves?

> Even if legal action were to ensue, you'd most likely only be asked to
>withdraw the game from any PD libraries/archives you posted it to.

Uh-huh. "Most likely." Suppose you're in that 1% "unlikely" bracket
that includes a $1 million lawsuit. Oops! Guess you lost the
lottery! Too bad...

>You made no profit ...

This is NOT relevant except in that it may get you some sympathy. If
you burn down a building you don't make any profit either. But you
still do damage. (Though that would also be a criminal offense.)

> I welcome further comments from those with knowledge of UK law. If you
>have little knowlegde of UK law, then your comments will be of no relevence,
>no matter what internation conventions you cite. Sorry.

It's unfortunate that you're confident enough of yourself to give
advice that could leave people destitute for NO GOOD REASON. Sorry.

>Firstly, will there always BE such things? The atari didn't exist
>when most of these games were first published, and secondly,
>how do you find out who does have them?

I suspect that the rights to a given platform don't disappear, even if the machine is no longer being made. In the case of new machines, it probably depends on what licensing agreements the original holder of the rights has signed. If they haven't signed them away, they have rights for every machine. The "look and feel" of a program isn't restricted to one implementation. This is still a grey area, however, so making bets one way or the other is unwise. (Read the regular columns about computer law in the Communications of the ACM for vivid evidence of this.)

>In the UK, I mean, seeing as most Spectrum software was british, and
>there isn't a copyright registry here, as far as I know... you publish,
>and it is copyrighted because you say so.

The exact implemenation of enforcement is surely different from what the United States does. The registry only affects your damages here. But the UK does follow the Berne convention; they sort of have to to avoid annoying other countries. A recent example is Taiwan. The US (among others) was getting miffed that Taiwan wasn't enforcing copyright conventions, because they were losing money from massive copyright and patent infringements in Taiwan. Taiwan recently gave in to the pressure and came on board. So while it's true that countries are gven freedom in how they choose to enforce the copyright conventions, they can't just ignore them without paying a heavy political price.

If a UK company cloned a Quadra and exported them to the US, for example, and the British legal system prevented anyone from doing anything about it, you can bet there would be hell to pay. And this works both ways, of course. GM can't go copying Jaguars without a lawsuit. Here we're getting into patents, but the political ramifications are similar. (Consider a UK company's ripoff of Micrsoft Windows, for example.)

>You may
>>find that a little old grandmother in Tulsa holds the rights and is

Yes. I don't know if it was actually Tulsa, though. :)

>Dave - so what did you do with Hacman, then?
>I remember reading that Atari asked you about that when you went
>to see them with Game Workbench - did you make any arrangments?

Simply put, they threatened to sue me. I haven't distributed it
since then. (I.e., I haven't made newer versions available.)

>Most of these were by one-man
>companies, operating out of their homes. I know that strictly speaking,
>this make no difference - but I am hoping that because the copyright
>holder will be the programmer in this case, rather than the big faceless
>corporation, it will make a difference. Heh, we will see.

Yeah, but why take the risk? Because the company was a one-man operation,
it should be easy to work out some agreement. Just ring up the dude
and see what he thinks. All I'm saying is that you shouldn't go into
this blindly, because if you do so you are putting yourself at serious
risk -- for nothing.

What did I gain from HacMan II? Nothing, really, except personal
amusement. Yet I put myself at tremendous risk by writing and
releasing it. Don't make that mistake. Old games beg to be ported,
but it's not worth the risk unless you get permission.

>That game was really nice to play - but it is only available for the spectrum.
>It would be very nice on an ST with sound, colour (it was pretty much mono),
>and disks. It could also be a nice multi-player game with a MIDI link.

Yes, it would be nice. But think about it from the point of view of
the original author. Maybe he would be unhappy that you've ripped off
his game. You just don't know. You need to find out before releasing
anything like that. Again, you may hit the jackpot, as Id did with
Castle Wolfenstein. Those bastards didn't even credit Silas Warner.
And it's perfectly legal.

> It seems to me that there are a lot of ideas out there that just died

>(relatively) current hardware.

The alternative, of course, is to use those great ideas in original
games of your own. Instead of cloning Archon, for example, make your
own game along those lines. Make entirely new pieces, give it a
science fiction setting, make the board different, etc. But don't just
clone the original (or come close), and for God's sake don't publicly

tout your new game as "an Archon clone" or name it something like
"Arrchonn." By doing that you'll just invite trouble.

If the Falcon can do 768x480x16 bit interlced this works out at a bandwidth of 2949120 bits for each full refresh... If I've worked this out right then you could easily have 1280x960x2 bits (4 colours). That would be lurvly on a 17 inch monitor but a bit of a mess on a 14inch VGA :).

While Atari's market share in Oz is much as it is everyplace else (poor),
there is indeed a strong Atari presence and at least one really good Atari
users group in Sydney, A.C.E. of NSW.

I'll send details to Eric via email.

>yet?

I was one of them, and I don't believe I said "in a week." My dealer said "In 2 Atari weeks." He then translated that as probably 2-4 weeks normal time, maybe a month. I ordered on May 1, or whatever day close to that was a Saturday. I called the dealer on May 20, and he said things still looked good for May 28 or so. I'd be interested in hearing if anyone else has gotten delivery of a Falcon through a dealer in the US yet.

The camels back is about to be broken, fellow Atari users. After posting a Washington only message on a great Falcon deal we were offering, I checked back with out distributors. Aparantly, even though we were given the _exact_ same price on _four_ seperate occasions, the dealer price of a Falcon030 just went up $500. Although, the list price went _down_ $100. (Now at $1,299) I'm really close to giving up, fellas. I cannot offer the deal I was planning on ($999 for an F030 4/65, with a sweet deal on VGA monitors (like $249)), and at this point I really don't see too much point in the matter. I'm _really_ getting frustrated. Also, with all the bickering going on in every single ST newsletter/magazine/online forem/ad nauseum, I'm loosing faith in the average Atari user. Major downward spiral, and I'm loosing hope.

I was wondering if anybody was interested in maybe drafting a letter for everybody to sign (i.e. attatch names and email addresses on the end) and Fax off to Atari Corp's management. I think (hope) something like that would help. Otherwise, I'll just get a PC and join the herd.

Sadly signing off,

I've been "out of the loop" regarding Atari machines for a while. Frankly I got fed up with their lack of support for the one I had. Sadly I defected over the clone market and got myself a 486-50 recently. I've been kind of unifored about Atari machines lately and would like to catch up.

What I would like to here most are the specs on the Falcon. I haven't heard much on it other than stuff about its graphics capabilities. If someone can convince me that Atari can still put a good machine together and support it properly, I'd gladly come back to them. I'm more than a little peeved at Microsoft right about now, so I really shouldn't be tempting myself to dump my my machine, but please mail/tell me what you know.

Thanks in advance!

You can get it now in the Graphics directory...I think you must have tries
to get it from the New directory, which you can't. You can also get it
from the Newitems directory while the file is still "new".

Hope this helps...

Ballblazer is out for the ST, under the title Masterblazer. It has a few small enhancements, but the same basic game. Very good stuff.

This thread is prompting me to pick up a used 8-bit (and grab all my old games the next time I visit my parents). I might actually have a good use for the big idiot box in the living room . . . .

Hey, does anyone remember SSI's Cosmic Balance II on the 8-bit? Great spacewar strategy game. I would love to see an ST version of it.

Yes.

>Saving a file from an application might even mean dragging an icon out of the
>application into the file manager?

Not yet (dragging *to* the desktop isn't implemented in the current
version of MultiTOS). It will be possible in the next version.

>If someone can send me more details of MultiTOS and TOSWIN I'd appreciate
>it.

TOSWIN has nothing to do with MultiTOS, really, except that it's an application
that can run under MultiTOS that can run .TOS and .TTP programs in a
window. The MINIWIN program that comes with MultiTOS also does this,
but does it better (IMHO: but I wrote both of them, so MHO should count
for something :-)).

Hmmmm, I dunno....never heard of "Aztec Challenge"....then again, it might
have been marketed under a different name! The game was, more or less, a search
for "The Idol of Quetzalcoatl (sp?)" (Ta-dah!) ! It was a horiz. arcade game..
platformish...among the beasts you fight was croc's, tigers, dinosaurs (!),
big spiders, and some kind of tentacly being (took up the whole lower part of
a blimmin' screen!)

Same game? Whatever it is, I lurved it!! :)

I have an ATARI 520ST for sale. Below are the items what you will get.

(1) ATARI 520ST computer--512KB RAM
(2) TWO external 3.5 floppy drives
(3) A brand NEW monochrome monitor
(4) ALL ABACUS books on ATARI ST
(5) Games
(6) Compilers--PASCAL, LATTICE C, MAGAMAX C.
(7) Word Processor--ST Writer
(7) An EPSON dot matrix printer

Make an offer. I am a DOS/UNIX man now. All equipments are in good shape. I rarely use the computer and have kept in good conditions.

E-mail addr: sang@tss.com
(415) 617-2247 (10AM - 6:00PM Weekdays).

Sang.

Actually, if you read through the doc file included, you have the option of
dumping everything into a directory called, oddly enough, "Insect".
Only thing is, if you're running of floppy, the game will demand that you
not write protect the disk.....(for all those luverly, or in my case, terrible
highscores). Interestingly enough, its even hardrive installable! Just copy
into "<drive letter>:\Insect\"! Boy, aren't I a helpful little bugger today...

From: alrashi@ecf.toronto.edu
Message-ID: <C7EI2J.65J@ecf.toronto.edu>
Source record: 205518

Sorry to bother....

I'm looking for the best (in your opinion) shoot-em-up in the PD/Shareware market these days. Any suggestions can be mailed to me, or if you want, posted. I've tried Insectroid already, and although it's pretty good, I hate how the sample of the dying insects cut into the samples of the shooting and explosions. Currently, I'm in a shoot-em-up frenzy (I've dl'ed about 10 shoot-em-ups in the past two days...) so any replies would be appreciated. If the games are STe enhanced, so much the better. I don't think there are any STe only shoot-em-ups out there, so I wont get my hopes up *snif*.

BTW, I only have a 4meg STe.....

Thanks!
Oh yeah, please tell me where to get 'em too!! :)

On a different note, where would I be able to get the FalconScreen utility? (No, I don't have a Falcon yet....but it would be nice to be ready when I DO get one...!)

Thanx to anyone who replies! :)

Vaya con Dios,

Source record: 205521

I have an ATARI 520ST upgraded to 1meg, two double sided disk drives (internal and external), AdSCI ST ICD 40meg hard drive and AT Speed installed on my computer.

The question, I have disabled the caches, reduced the folders, etc, I'm running Neodesk 3 and still only end up with 555000bytes of free memory out of the 1meg, does this sound appropriate? It seems to me I should have more free memory than that? I do have a few of the auto run programs in my Auto folder for boot up and to run Neodesk. The ACC I boot only take up about 20000bytes tops. Any suggestions as to the best set ups of my hard drive and Neodesk(or should I use it) to obtain more free memory?

Thanks.....

Les.....

If I am understanding you correctly, the answer is yes. You can drag a
data file and drop it onto a program icon and it will launch that
program. You can also drag a data file and drop it onto the filename
if the window is still open. For all intents and purposes, it appears
to me that launching programs in this manner works exactly as if the
program were installed as an application, temporarily.

Interestingly enough, under MultiTOS, you can BLOW AWAY THE DESKTOP and
still run programs. Launching programs is then accomplished via a file
selector.

7346. Bombs.

Newsgroup: comp.sys.atari.st
Date: 1993-05-22 02:19:28 UTC
From: alrashi@ecf.toronto.edu
Message-ID: <C7Ep4H.HxI@ecf.toronto.edu>
Source record: 205524

Does anyone have a listing of what x numbers of bombs mean (where x = 1 to current maximum)??? Since the FAQ has been dropped in favour of a new diet version, I can't look it up there (sorry).

On a different note....
Is Cybernetix (horiz. scrolling Defenderish game) non-STe compatible?
The game loads up to the game screen, but then bombs out. I've tried every conceivable thing...from playing from root dir to playing in PAL (50 khz)!!
The funny thing is, the _first_ time I played it...it seemed to work fine!!
Every consecutive time I've tried it, it refused to work! I've even tried downloading the copy @ a.a.u.e. but to no avail! Any help here will be appreciated!

Vaya con Dios,
AcEzE.

This does not have to do with MultiTOS, this has been a feature of Newdesk since the first TT's came out. Under MultiTOS, if you drag a data file to the icon of an application that is running, it will simply run another copy of that application, not transfer the data file to the currently running application. At least this is true with programs not written especially for MultiTOS. The viewer, for example, creates it's own "icon" that floats around the desktop when running. If you drag stuff to this, then it will be loaded into the currently running copy of viewer. If you drag the file to the viewer.app program on the disk drive, it will launch another copy of viewer.

Golly, Glen... if I thought you actually knew how to read, I'd ask you to quote me back the last time I "ranted and raved" about Atari's stock dropping by a penny or two..

But since you seem to be convinced that you've actually read messages like that, I guess I'll just have to chalk it up to your overactive imagination, and not to your ability to read.

Tell you what.. when the stock price gets back up into the kind of range tha says investors are once again taking Atari seriously, we'll both rant and rave together... how's that..?

You should set NeoDesk to unload from memory when executing another program. TSRs and ACCs can use more memory then their actual file size. I have less than 3MB free on my 4MB machine, and I use the built in desktop. Best thing is to get more RAM.

I just went down to my local bookstore and got a copy of STFormat. They have on the front cover: "150,000 new owners" Due to the cut in prices on the 520ST.

Perhaps this has something to do with it...?

Here you go.

----begin included text----

Ever wondered what those TOS error messages and 'bombs' on your
monitor signified? Below is a letter, originally written by Darryl
May, that John Townsend of Atari posted on GEnie in January to provide
some answers. This letter also appeared in the June 1988 issue of
Current Notes (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear
while you are operating your ST computer. This first list gives you
the GEM error messages:

Error description GEM Error code
==
OK (no error).....0
Fundamental error.....1
Drive not ready.....2
Unknown command.....3
CRC error.....4
Bad request.....5
Seek error.....6
Unknown media.....7

7358. Re: Falcon DSP

Newsgroup: comp.sys.atari.st
Date: 1993-05-22 20:11:00 UTC
From: care@taliesin.emi.u-bordeaux.fr
Message-ID: <1993May22.201100.29795@greco-prog.fr>
Source record: 205548

Claus-Dieter Schulz (schulz@kssun7.rus.uni-stuttgart.de) wrote:

: I like to know if it's possible to write own DSP
: programs. Are there any tools available.

Well, in fact, there are tools to write programs for the DSP (Motorola's
56002 dsp), such as a gcc version for the dsp56000 or an assembler made
in lexx-yacc for the dsp56000. All this stuff is freeware, so...
There are also commercial stuff such as a powerful (do you know Adebog ?)
debuggers or editors/assemblers...

..So don't worry and buy your Falcon, it's a wonderful computer.

: Second I want to know is if I could connect a CD and/or DAT
: digitally to the DSP. I know there is a DSP connector
: but it is not documented and the local dealer said that
: one needs a special interface to connect CD/DAT to the
: Falcon which is not yet available and will be expensive.

There is truth in what the dealer said to you, you need a very small
'interface' to connect your CD or DAT player to a FALCON because
the clock frequencies of the Falcon's ADC (or something like that)
can't be set exactly to 44.1 or 44.4 Khz (but 50 Khz exist...)
so you must add a clock which frequency must be that of your player
(DAT or CD...) ... (and perhaps one or two components, but nothing
expensive)...
With that 'interface' (and it will soon be available I think...),
you just have to connect your CD to your FALCON by that small hardware
and all is fine...

In fact, all that is about 'direct' digitization with the DSP connector,
but it's also possible to digtize via your jack connector... so, in that
case, nothing is needed but a small jack-to-jack cable...

>The best defence against logic is ignorance.

Personally, I don't see the point in buying a F030 to run Cubase. The
price of a F030 in the UK is MORE than the cost of a good pc, with
hi-res graphics and a decent hard disk etc. Get a MIDI card for a couple
of hundred pounds and I reckon it's a better deal than an F030.

One of the attractions of Atari's over pc's when it came to midi was
that the st was under 300 UK pounds wherease a pc was closer to a
1000. With the Falcon that's not the case.

You're missing the point.As well as all the MIDI facilities,the Falcon
also happens to be an excellent quality sound sampler and synth-have
a look at how much a dedicated sampler would cost that is at least comparable
to
the falcon.And it pisses on PC's graphically as well.

Hey, atari-archivists, would it be possible to make the output of "ls -lRc" available on atari.archive.umich.edu, in addition to the regular ls file? Note the "c", which will sort based on date instead of name. The reason for this is that I never find the time to keep a monitor on the Newitems directory anymore, so I have to search for the new stuff when I do get a chance to snarf files. I also have to do this after a vacation (yeah, feel sorry for me :-). Having a date-sorted list would be a big help.

My alternative is to write a perl script to resort 0ls-lR.Z. Bleech.

Are you stoned? The falcon records with 16 bits only. playback can be
8 or 16. If you don't believe me, look at falcon.h

Why would every single ad and flyer for the falcon have 16bit audio on it?

there are some '8's in the falcon, like some modes have 8 bit color, and
there are 8 channels of sound.

You really haven't heard of this?

Looks can be deceiving. It is much more likely that a few people
are playing games with the stock. The volume is still VERY
(and I stress VERY) low. Anyone with a couple of grand in their
pocket can make that stock bounce up and down all day.

I'll believe in the "forthcoming good news theory" when a stock
price increase is accompanied by moderate volume.

Cheers,

Chris

Hmm, just when everyone is talking about old games...

I have the game TRACKER for the ST, used to like it very much - until I built a TOS 1.04 into my 1040ST some years ago.

The game itself still seems to work, but the mouse control is gone...

Also doesn't work with RAM-TOS 1.0 or whatever; only with the original TOS1.0 ROMs...

Does anyone know of a patch or something like that, to make it work with newer TOS versions?

/\|ex.

Below is part of a letter, originally written by Darryl May, that John Townsend of Atari posted on GEnie. This letter also appeared in the June 1988 issue of Current Notes. This is fairly old info, but it probably applies to all the 68000 ST's.

Those bombs that appear on your screen are error messages from the 68000 micro-processor.

7386. STReport is worthless

Newsgroup: comp.sys.atari.st
Date: 1993-05-23 23:08:41 UTC
From: timf@nic.cerf.net
Message-ID: <1tp05p$qtf@news.cerf.net>
Source record: 205620

This quote came from the May 21 issue of STReport, along with much griping, negative slanting, and hand selected positive reports about PC platforms:

>psssst.
> FYI.... The Shareholder's equity is fine.... NOT!
>
> The Stock is hovering around $0.81

In Actuallity the stock is trading closer to 1 and 1/2, and hit a high of 1 and 5/8 on both thursday and friday of last week. This is just sloppy inaccurate, non credible reporting. This magazine is totally out of touch.

I had heard very positive things all week, including a rumor that a ship load of Falcons had been sighted going through customs, and a News release that Atari had licensed Supermac's Cinepak technology (also licensed by Creative Labs, Apple, and 3DO). I was hoping to get some info on these from STReport. They didn't even mention the press release on the Cinepak technology in there news summary. There were just too many PC related press releases to get in I suppose. Later a user quote mentioned that he read an article on it.

If you are looking for any type of unbiased credible reporting on Atari don't bother with this magazine. They seem to be totally caught up in an anti Atari vendetta. I don't even know why they continue to publish. If everything is so hopless, and Atari is going bankrupt, and the stock is crashing, and the Falcon is cancelled, and there is no software, and BLAH, BLAH, BLAH, you would think they could spend there time on other things.

Tim Fitzgerald (fitzgera@nic.cerf.net)

Sh*t, we've been hearing this exact same line for 2 months now. This is
pathetic, it makes it sound like Atari is run by half a dozen people...
We hear about every machine that comes into North America! Why don't we
post the damn serial numbers? Meanwhile C= has unfortunately been stamping
out 1200's like cookies for around 6 months. It's already too late...

Appearing soon on atari.archive and c.s.binaries.st:

S C R O L L I N G T H U N D E R
Text File Viewer v1.0
by Ken Newman

DEMO VERSION

Scrolling Thunder is a viewer or browser for text files (actually, any kind of file) with a difference. It exclusively uses hardware smooth scrolling, available only on STe/MegaSTe/TT/Falcon, to produce the smoothest, fastest display of text you've ever seen. It scrolls forward or backward at variable speed, and is almost entirely mouse-controlled. It is completely free of the restrictions that annoy me about virtually all other text viewers. There is NO limit on line length (and I mean no limit - you can give it a binary file if you want), no fixed tab size, or fixed end-of-line character requirements. It can load fonts and search for strings, is compact and unbelievably fast. The user interface was the primary design consideration - it's effortless and requires very little to control it. It uses the entire screen and displays full-sized characters, which makes text much more readable (and faster to draw) than vdi text in a window. After seeing smooth flowing text for a while, everything else looks jerky! It's amazing how bad the desktop Show function looks for example after using Scrolling Thunder. The effect is not unlike the scrolling credits at the end of a movie.

There are two versions of Scrolling Thunder, colour and mono, that together will work on all current machines and monitors *that have hardware smooth scrolling* - TT/Falcon will have to use ST medium or high resolutions. The program does NOT work on regular ST/STfm/MegaST systems. Scrolling Thunder is shareware; details in the archive.

Hi,
While checking out the goodies available at ftp.cs.ruu.nl, I found
a universal synthesizer patch editor librarian called glib which looks
pretty intersting. It is supposed to run on an assorment of systems,
including mac, atari, Unix, etc. Unfortunately, only the C sources are
there, and I don't think I have enough memory in my computer to
compile it. So, here are my questions:
1- Has anybody used the program? Is it worth trying?
2- Has anybody out there either compiled this thing (and has the necessary
executables to run it on an Atari ST), or know of some ftp site where these
files are available?

Thanks a lot
Gustavo Comezana

Correct me if I am wrong, but the plethora of 24-bit colour cards
cost at a minimum of $150, and are not part of the system, per se.
Whereas on the Falcon, gee, you get the colour controller built in.
Yea, so it may be have 64 bits of 4 gagillion colours, but its all
stock.

7392. Graphical NetHack! FULL COLOUR! 850 icons! TT & Falcon!

Newsgroup: comp.sys.atari.st
Date: 1993-05-24 00:34:46 UTC
From: warwick@cs.uq.oz.au
Message-ID: <13522@uqcspe.cs.uq.oz.au>
Source record: 205625

I have just uploaded "nh311gem.zoo" to atari.archive.umich.edu.

This is, IMO, a MUST HAVE for anyone with a TT or Falcon, and a MUST SEE
for anyone who's played the old character-based NetHack (even if you thought
it was boring).

I've put a TONNE (1.1 TON) of work into this port. 150K of graphics,
and a lot of code.

NetHack 3.1.1

Graphical GEM Version for Atari Computers

by Warwick Allison

No longer do you have to play NetHack with silly character graphics!

OVERVIEW

This port of NetHack 3.1.1 gives you full-colour graphics, plus a
completely GEM user interface. Not to be confused with the hackfnt
technique of simply changing the font, THIS version gives you
16x16 pixel, 16 colour graphic icons for EVERY OBJECT IN THE GAME -
that's about 850 different icons.

REQUIREMENTS

Being a GEM application, this game will run in many graphics modes,
however it is by far the best when played with:

- 16 colours
- AT LEAST 640x480 pixels

This means that the game is not really playable on the standard modes
of old ST, Mega, and STe models. It will, however, run in such modes,
but with most of the playability lost. Run it in ST-medium to the
see basic interface, then run it in ST-low to see the neat graphics...
then try to imagine what it is really like...

and get a Falcon, a TT, or a graphics card.

This version also requires at least 2 MEGABYTES of RAM: the program
itself is more than 1M, and the graphics consumes 350K.

THE DISPLAY

There are 3 windows, initially placed in the order:

- Message window
- Map window
- Status window

The Message window is a scrolling window of messages. Make sure you keep an eye of these messages - they mean the difference between death and maybe death. Note that it works a little different from the normal NetHack message display: you will always see the 5 most recently output messages.

The Map window is where all the action happens. It is a scrolling window, although in 640x480 modes, you can see the full height of the map, and half of the full width. It scrolls automatically as your player moves around the map, and can be manually scrolled with the GEM scrollbars, or by using the arrow keys. You may select to have a box around your player by choosing the "Map cursor" menu item - this is most useful if you drink a potion of invisibility!

The Status window is exactly as appears in the traditional character-based NetHack. I won't go into details of NetHack itself - read the NetHack documents for that information.

THE CONTROLS

Both mouse and keyboard controls are available at all times.

Experienced NetHack players will generally use the keyboard 95% of the time, but it is handy to have the GEM menus at the top of the screen for those less-often used commands.

The GEM menus have the keyboard equivalents displayed with them, so the beginner can quickly learn the more common commands (selecting 'Get' will drive you crazy if you don't learn that ',' is the keyboard equivalent).

The map can be clicked on to move the player around, but this gets VERY tedious. Use the numeric keypad (8 directions) to move the player:

```
N
|
7 8 9 5 = self / rest
```

W-4 6-E Shift-number to move in that direction until a corner.

```
1 2 3
|
S
```

When scrolling about with the arrow keys or scrollbars, the HOME key will return the view to your player.

During pop-up dialog boxes, the UNDO key will ALWAYS end the interaction
with a non-response (usually undoing the activity without effect).
The ESC key also ends interaction in MOST pop-ups. It doesn't end
a "get line of text" pop-up, because the standard GEM user interface
uses the ESC key to clear a field. You would agree with me that you
don't want ESC to cancel the pop-up when you are asked to wish for
something...

Also in pop-up dialogs, keypresses can be used to select options - just
use the keys depicted in the pop-up. The RETURN key selects the heavy-
outlined button, as per the GEM user interface.

Tim Fitzgerald (timf@nic.cerf.net) wrote:
: This quote came from the May 21 issue of STReport, along with much
: griping, negative slanting, and hand selected positive reports about
: PC platforms:

: >psssst.
: > FYI.... The Shareholder's equity is fine.... NOT!
: >
: > The Stock is hovering around $0.81

: In Actuallity the stock is trading closer to 1 and 1/2, and hit a high of
: 1 and 5/8 on both thursday and friday of last week. This is just sloppy
: inaccurate, non credible reporting. This magazine is totally out of touch.

I haven't read STReport in ages, and I do remember it being worthless
trub. However, these price quotes are accurate. The stock price
was hovering between 3/4 and 1 for months. It only recently, Thursday
and Friday to be exact, spiked up to the 1 1/2 range. If STReport
was dated on or before 5/20/93 then the information is pretty much
accurate. Even if it was dated 5/20 or 5/21 the author would have
had to check his/her quotron at the "presses" to get the price
correct by your definition.

: I had heard very positive things all week, including a rumor that a ship
: load of Falcons had been sighted going through customs, and a News release

Well, it remains to be seen if this is good or not. A ship full of
devices which are seemingly overpriced and outgunned may just be
another chapter in Atari using their valuable warehouse space to
house equipment that they cannot sell, only to take a loss on it
later.

: that Atari had licensed Supermac's Cinepak technology (also licensed by
: Creative Labs, Apple, and 3DO). I was hoping to get some info on these

I saw that report too. It was one of the few positive notes about
Atari I've seen in a while. However, it is also a VERY recent
news item and I'm not surprised that it hasn't made it into any
of the electronic rags yet.

: from STReport. They didn't even mention the press release on the Cinepak
: technology in there news summary. There were just too many PC related
: press releases to get in I suppose. Later a user quote mentioned that he
: read an article on it.

What's wrong with the PC related stuff? I must confess that it has literally
been years since I've seen any of Ralph's (is that his name?) electronic

blathering. Is the magazine supposed to be ST specific? Even if it is,
you cannot control what the "owner" wants to put in it, except by
refusing to read it or pass it on.

By reposting his "misinformation" on the net, you have done more
to spread it than he has.

: If you are looking for any type of unbiased credible reporting on Atari
: don't bother with this magazine. They seem to be totally caught up in
: an anti Atari vendetta. I don't even know why they continue to publish.

Then why are you reading it?

: If everything is so hopless, and Atari is going bankrupt, and the stock
: is crashing, and the Falcon is cancelled, and there is no software, and
: BLAH, BLAH, BLAH, you would think they could spend there time on other
: things.

I agree. It sounds like a major waste of time.

Cheers,

Chris

>24 hours!)
>
>Besides, ever heard of personal opinion?

Well there's personal opinions and personal opinions.

It's a little naive to claim that the "standard" is VGA. There never was
a very strong standard, CGA,VGA,MGA,Hercules,8514 and SVGA could all be
said to be pc standards.

C'mon, in reality no pc is sold today without svga cards which means
256 colours and 1024x768 resolution. That's just basic, for a little
extra the new accelerator boards have higher resolution and more
colours.

One of the things that's always frustrated me about atari's is that
their graphics are 10 years out of date. Even the new falcon only does
something like 600x400 (someone with the exact specs can correct this).

Off the top of my head I believe my BBC computer did something like this
and that's definitely 10 years old. (I doubt anyone outside the UK knows
what the BBC computer was but never mind).

Personally, I can't see the Falcon competing with machines in it's price
range. It's not in the same league as a 33Mhz 486 with svga and as I
said in my previous post the midi card would only be a little extra and
come to that a sampler too --- incidentally, who wants an 8 bit sampler,
if you're a serious musician and I can't see the idle hobbyist forking
out that much money, then you've got to have a 16 bit sampler.
(OK perhaps I'm stretching the comparison here since that would probably
make the pc 500 pounds more expensive).

The ST is a bargain (even more so now they're dropping the
price) for those, like myself, who want to enter the world of
hi-tech music. I really couldn't justify buying a Falcon though. It's
FOUR times the price of an ST and in that price bracket there are far
better machines available.

The Falcon has a 16 bit sampler. I've used it myself to record at 50 KHz
16 bit stereo, directly to disk, in the background. Show me a PC that can
do that out of the box for that price...

ST-Report has had that same quote since December, among a LOT of
other stuff which is repeated every month.
(I worked out that over 50% of the material in that magazine is either
repeated *every* issue, or is just pointless advertising. very little
is actually original material, much less so than Z*NET anyway!)

I can't see why he bothers with it, as so few people see it in the end....

There are many Atari user groups in Australia, just from memory
Melbourne Atari computer enthusiasts
ACTARI - ACT
QUACE - Queensland
GAUG - Geelong Victoria
The main dealer in Australia is Paragon Computers in Western Australia
who provide a good level of support. I can't say the same aboutAtari or
most of the other dealers. Some who have tried in the past are being
given a hard time by Atari Aus over the new Falcon.

(as a member of the TT dev team I guess I can comment on this 8)
Yes, Linux will probably require 4M of fast RAM as a minimum. It will _not_,
unconditionally, run on anything less than a 68020/68551, in other words,
it will (we hope 8) run on a TT or falcon030. It _may_ be possible to
run it on an SST or TinyTurbo 030. This depends on someone with technical
information on these devices coming to the party. (I can't remember if the
TinyTurbo has an EC030 or not - if it does, then it's out of contention.)

>I have a TT which will soon have 20 megs of RAM. Can I run X-Windows

>programs? If not, is it concievable that they could be run in windows on
>X-windows? If I compiled hello.c under Linux, could I take the binary and
>run it on a non-linux machine (i.e., a 520 or something)? If I compiled a
>GEM program under Linux, could I do the same thing?

Okay. Right now, the answer to all of the above is no. LinuxTT does not
exist yet. It may not exist for quite some time in fact. At the moment, all
030 development is trying to remain in sync - the TT effort at the moment is
centred on getting a consistent development environment, and on resolving the
differences between the amiga and TT hardware. Once these are out of the
way, things may move a little faster.

The 'projected' answers to your questions :

You will be able to run X if you have a 19" mono screen. Do not expect X on
a colour system unless you want to write the video-dependant parts of the
server code yourself. You will not enjoy it - there are fundamental
differences between the way X likes to think and the way the TT does.

You should be able to have LinuxTT and TOS filesystems on the same disk unit,
however it is unlikely that you will be able to run TOS/GEM programs
under Linux.

A LinuxTT binary will not work under any other operating system, however
you would be able to install a compiler such as gcc to cross-compile for
other operating systems/architectures. This would include compiling
GEM programs.

Please, don't get too carried away about this yet. Linux was written for the
386. It thinks very much like an intel processor in a PC, and it is going
to take quite a lot of effort to tweak.

|>
|>
Well, I have written a file selector for MiNT. That means, that it overcomes this 8+3
names. If the GEM-program saves enough space for Path and File Name
then it is no Problem to use with MINIXFS under GEM.
BTW: My file selector is available from ftp.uni-kl.de and ftp.uni-muenster.de.

Regards,

Marcus

7407. Info on Wordflair II wanted

Newsgroup: comp.sys.atari.st
Date: 1993-05-24 10:01:24 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <1tq6dk$qn3@rw8.urc.tue.nl>
Source record: 205639

Hi,

Hisoft now has a good offer on Wordflair II in combination with
SpeedoGDOS. I am thinking about buying things but I would like to hear
first what other people think of the program. I know there was a review
of Wordflair II in Atari ST User in the Feb issue, but that happens to
be the only issue I missed this year.
Questions I would like to see answered are the following:
Is it any good or does it have serious bugs?
Can I make texts with multiple colums in it?
What file formats does it import/export?
Ascii import/export?
Is the database in it any good?
Can the database use large text objects?
Can I mail merge with the database?
How is graphics handling?
Support for GEM vector pictures?
Not really applicable yet, but would it work on a Falcon?
Under MultiTOS?
Does it do autmatic reformatting?
And can it make a table of contents automatically?

Well that is about it. I would especially like to hear about the import
export possibilities and how good the manual is.

e-mail to wmtwen@urc.tue.nl and I will summarize.
Thanks in advance,

Erlend.

7408. Buying an ST for sequencing ?

Newsgroup: comp.sys.atari.st
Date: 1993-05-24 10:10:36 UTC
From: jhu@bdk.tue.nl
Message-ID: <jhu.63.0@bdk.tue.nl>
Source record: 205640

I have both a crappy pc and an Amiga, and these two computers aren't the
best in the world to do some midi stuff.
So, I thought about buying a 2nd hand 520ST, to run Cubase.
This is (for me) one of the cheapest solutions. (I don't have the money to
upgrade my PC, I'd rather spend my money on music equipment)
My question is.... does Cubase run perfectly on a 520ST with 1Mb ?
Or are there some setbacks.....?

Your help would be apreciated..

Greetz...
Jakko van Hunen....

7409. Re: Atari ST software?

Newsgroup: comp.sys.atari.st
Date: 1993-05-24 10:36:11 UTC
From: lancer@ramanujan.WPI.EDU
Message-ID: <LANCER.93May24103611@ramanujan.WPI.EDU>
Source record: 205660
Cross-posted to: rec.music.makers.synth,comp.sys.atari.st

I previously posted that I just bought an Atari 1040ST so I can play
with it and try out some music making on it. I've learned a bit since
my last post, but still have some questions...

>>>>> "hjv" == Hendrik Jan Veenstra <hjv@phil.ruu.nl> writes:
>What software can do what?
[too broad]
Ok, I want to be able to do the following: Sequence and mix MIDI from
keyboards and drum machines. This means like 6 tracks of MIDI data.
I also want to be able to sample and edit these samples graphically
(ie cut out, loop, and move). Which software should I look for to do
these two things, where can I get it, and how much will it cost?

>How expandable is it?

hjv> Add a 68000/16MHz, install a DOS-emulator, or a Mac-emulator
hjv> (fabulous!), graphic cards, upgrade your OS to TOS 2.06 (I
hjv> think), add memory (up to 4 Meg), buy a hard-disk, install a HD
hjv> floppy drive, ...

I have a software MAC emulator coming with the machine. Where can I
get a 68000/16? And how much $$? Also, it takes Mac-style SIMMS,
right? So which is the best place to get these?

>It has a 68000. Can I replace that with a 68010 like in an Amiga?

The reason I ask is that I have a spare 68010 sitting in my room...

>I would assume I can add a hard drive. Am I assuming too much?

hjv> No, if you look at the back of your machine, you'll discover the
hjv> harddisk connector. But beware: Atari doesn't use SCSI, but
hjv> ACSI, so before buying, check out that indeed the HD is
hjv> Atari-compatible.

Which manufacturers make ACSI HDs? I read the faq for the st groups
and it seems like they're saying to go with an adapter and a SCSI
drive. Which is the best way to go?

Thanks,
.s.

PS: the real reason I bought an ST is that I've wanted one since I
gave up my old Atari 800XL for an IBM PC. The PC was cheaper...
Boo-hoo...

7410. PC CLONE PRICES IN NZ..

Newsgroup: comp.sys.atari.st
Date: 1993-05-24 11:09:57 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1tqae5INNfmk@golem.wcc.govt.nz>
Source record: 205644
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

*** NEW ZEALAND PRICES OF PC CLONES.... ***

Some one was after the prices of PC Clones here in New Zealand,
but Please note, are Dollar is about 54c US..

These are current prices from PC General...

Some of the features are..

1. Local Bus Windows Accelerator with 1 meg Ram..
2. 16 Million True Colours, Muti-Mode RAM DAC..
3. 2 VESA Local Bus 32 Bit Slots..
4. 4 megs of Ram..
5. 14" Mutisync Monitor 1024*768, Non-Interlaced, 30-60k 72hz..
6. Upgradable CPU to Pentium on 486 machines..
7. 1.4 meg Floppy..
8. 129 Key Keyboard..
9. Calculator..
10. DOS 6.0 and Windows 3.1 Installed..

Prices are in NZ Dollars..

	120m	210m	340m I.D.E. HD
386DX-40	$2349	$2549	$2799
486DLC-33	$2499	$2699	$2949
486DX-33	$2899	$3099	$3349
486DX2-50	$3199	$3399	$3649
486DX2-66	$3499	$3699	$3949
EISA-66	$3849	$4049	$4299

So to get USA prices from these, please divide by 1.852

You have to add 12.5% Sales or Vat Tax..we call it G.S.T...

The estimated Flacon 4/65 price will be about $3000nz, with out Monitor,
including the 12.5% Tax..

So how do these prices stack up with the USA John..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

: >: 24 hours!)

: >There are a plethora (SAT word #4432) of 24-bit color boards available
: >for both Mac and IBM-clone boxes.

: >Chris

: Correct me if I am wrong, but the plethora of 24-bit colour cards
: cost at a minimum of $150, and are not part of the system, per se.
: Whereas on the Falcon, gee, you get the colour controller built in.
: Yea, so it may be have 64 bits of 4 gagillion colours, but its all
: stock.

It depends on who you buy the system from. A lot of manufacturers
include high-end video cards by default. 24-bit color is becoming
increasingly common.

Besides, $150 is peanuts when you consider that you can pop out
the card and upgrade to the latest/greatest video standard
by replacing the card. What do you do when you want to
upgrade the Falcon's paltry graphics...pour chickens' blood
on the shifter and hope for the best????

The ability to swap video cars is an asset, my friend, not
a liability.

Cheers,

Chris

Re Atari rights
> Firstly, will there always BE such things? The atari didn't exist
> when most of these games were first published
This doesn't affect anything. By implication those rights exist once
the medium exists and someone will own them. The exact question of
who will own them depends on many things such as how contracts were
worded etc. A similarly confused situation is happening at the moment
over CD-ROM compilations of magazine articles and whether the
journalist owns the rights to the article or whether the magazine
does.
If it helps then try thinking of this as being like translating
something into another language - just because the language wasn't
known at the time of the writing doesn't prevent there being
copyright in that language.

> In the UK, I mean, seeing
> as most Spectrum software was british, and there isn't a copyright
> registry here, as far as I know... you publish, and it is copyrighted
> because you say so.
Actually it is copyright (unless you specifically say otherwise) at
the time of writing, not merely after publication.

> One that made me wonder, was Sinister Developments' Galaxian that
> recently appeared... plastered with Bally-Midway logos and copyrights.
> Does anyone know if they actually asked Bally or if they are just
> 'doing the decent thing' and showing the original copyright?

If they are doing this without permission then they are open to all
sorts of claims - use of tradmark, 'passing off' (eg implying their
work is by Bally-Midway) etc.

But there have been moments of insanity.

> Damages? Paid from what? Non-profit making students (who probably have
> enough trouble paying their rent every week) don't have much money from which
> to take damages.

And if the case happens in a few years time when they are earning
lots of dosh? What about if we get someone who starts buying up the
rights to these games and then sets about suing people for
infringments - done properly I guess you could make a living at it
(although not the way that most ethical people would want to live).

> The Berne Convention certainly sets down some guidelines. However, in the
> UK, there has never been such an action (foreign rulings do not count), so
> any case would also be a LEGAL PRECEDENCE, in addition to being financially
> non-productive.

This is now wrong, as far as I'm aware their is a case which was
reported on in CTW a few weeks ago that may well have set the
precedent for look & feel. Certainly it is about a very similar
issue to this and would be relevant.

> Action would only be taken if:
> 1) The person, company or whoever bought out the copyright were still in
> existance (unlikely) and
Why - most people who wrote for the spectrum etc have not died, let
alone died over 50 years ago. Hence the copyright will still exist -
it may be difficult in some cases to find who owns it (eg company x
goes bust, is brought out by company y - ownership of copyrights held
by x will depend on several different contracts, what y brought, if
any of original authors had clauses returning their contracts in
situation of non-payment etc).

> a good idea to choose a game whose copyright owner is KNOWN to be defunct?!?),
This cannot exist unless the author died over 50 years ago - or the
company vanished in a very strange way. It may be (since they are
major prefered creditors) that either HM Taxes or Customs and Excise
own the copyrights on some games.

>Timothy Wilson ~-~Dark Oak Software~-~- Atari Explorer Online

Does this mean that we could easily use the Falocn as a rather good
data-logging computer? I remember that the old UK BBC computer had a 12
bit DAC that made it very popular in school science classes because
it was so easy to hook up to instruments. 16 bits would be really nice.
The Falocn could be used then as a cheap data-logging computer for schools.

While you're correct that an 486/33 is much faster, the Falcon *indeed* has
16 stereo sound input and output.

Hello,

If all goes well I will be buying a Falcon in the next few months, and
I would like a decent monitor to use with it. I know this has been discussed
before, but I have a few questions:

1) Can the ST compatible modes ie ST Low,Med,High be used with an SVGA
monitor, or do I need an sc1224 or multisync that will scan at 15khz
(I would like to run my old ST software)?

2) If I buy a multisync, is it worth getting one that does 15-40khz, or
should I not bother with 15khz and get one that does 30-60khz (bearing
in mind add-ons such as ScreenBlaster, graphics cards etc which will
provide greater resolutions)?

3) What is the chance that after buying an SVGA monitor, most programs
are written with TVs in mind and not VGA monitors. How dependent will
games and other software be on the screen mode and monitor being used?

4) Will programs like FalconScreen and super78 work on an SVGA monitor?

Thanks in advance for any answers,

Paul Donovan

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
I've got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham or Ladbroke Grove
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you can't say fairer than that, can you.

Leave a message on 081-693-2846 and Ill get back to you
as soon as possible.....

|>
|> Ian
The Falcon CAN do 1280x960x2bits with about 68Hz interlaced, but only with
additional hardware. Without hardware you'll get 44Hz interlaced :-<>
(flicker...). This is only possible in 4 colours and nowhere else ...
The better way is to use 1024x768x2bits with 103Hz interlaced (needs hardware).
I am working with 960x720x4 (16 colours, 93Hz interlaced) all the time (needs
hardware (BlowUP030), too). To say it simple, without extra hardware the best
you can get is not enough for your eyes (this has NOTHING to do with the number
of colour planes!)

> later.

I've seen this sentiment from many people in the form of a blanket statement; ie it's true for EVERYBODY. It depends a lot on a person's situation whether it's true for that individual or not.

Case in point: I was going to jump ship to the clone world. I wanted a clone hardware and software package that would enable me to do better DTP than I currently do on my ST. I did a considerable amount of pricing and discovered I would have to spend about 2450 dollars (US) plus tax in hardware and software. And that was WITHOUT stereo, MIDI, DSP, and SCSI.

Total price to ME for a Falcon to do better DTP: 1400 dollars (US) plus tax.

It's all relative.

What actually happened was Nintendo sued the programming crew for copyright,
because Giana Sisters was too close to Mario Brothers.The game was taken off the
shelves after about a week.Only pirate versions are available now.
BTW the same programmers were also forced to not release their R-Type clone on
the Commie 64 by another company.

> were trying to type!

Well, that is the "nature of the beast" when you play with penny stocks
and/or options. It is certainly possible to double your money, but it
is just as possible to lose it all. I am convinced that Atari's recent
stock increase is the result of some type of manipulative play. Somebody
is pumping money into the stock in an effort to boost it, but sellers seem
to derail it around 1 7/16 - 1 1/2 or so. I would be very careful if you
want to play around with this stock. It's like going to the casino...don't
put in anything you can't afford to lose.

Just for your info, here's the price/volume info for the last 2
weeks.

Cheers,

Chris

I just got this email from Francois Lionet creater of Stos/Amos
, I think all you Stos users should take a look.If Atari had an ounce
of common sense they would finance the project themselves ! F**K all chance.

Atari are you listening ??????????????????

Weeeeeell, I am very sorry, but my editor took a decision two weeks ago:
we dont want to make a Falcon version now. We wait to see what the machine
is going to become.
Sales of software on Atari machines are inexistent in Great Britain. Making
a Falcos is a biiiiiig project, and unless Atari pays for the entiere
development investment, Europress will not take the risk.
I am sorry, as I think this could have been a nice product.
Anyway, if the Falcon sells, be sure that there will be a Falcos.
In this case, it will not be compatible with the St. Too much of a hassle
to do a backward compatibility with such a small machine (compared to the
Falcon).
Cheers,

What exactly does $1400 get you? This isn't a flame, but I'm curious to know how "decked out" a falcon would be at that price point. I'm curious since I would like to compare it in my own mind to the Apple Centris 610 and IIvx line as well as a 486 box.

You get what you pay for,

Chris

Cubase runs on a 1MB ST, but it's much better with 2MB. If you have only
1MB you may have problems printing and you will not be able to have all
the modules (phrase synth, MIDI mixer, etc.) running at once. But that is
not a major problem.

You can run all ST resolutions on an SVGA.
>
>2)If I buy a multisync, is it worth getting one that does 15-40khz, or
>should I not bother with 15khz and get one that does 30-60khz (bearing
>in mind add-ons such as ScreenBlaster, graphics cards etc which will
>provide greater resolutions)?

A 15-40KHz will give you access to 640*480*true colour, while an SVGA can only do 320*240 in true colour. If this is important get a 15-40 multisync, if not get an SVGA which will do all other resolutions at 640*480.

>
>3)What is the chance that after buying an SVGA monitor, most programs
>are written with TVs in mind and not VGA monitors. How dependent will
>games and other software be on the screen mode and monitor being used?

That's not a problem because the Falcon emulates all ST resolutions.

>4)Will programs like FalconScreen and super78 work on an SVGA monitor?

I have two monitors, none work with super78 and only one copes with FalconScreen. You should not have any problems with the ScreenBlaster.

>Thanks in advance for any answers,
>
>Paul Donovan
>
>cstadbs@csv.warwick.ac.uk
>pmd@dcs.warwick.ac.uk

I've been grappling with the problem of "should I buy a Falcon" or not, and the main reason I personally haven't been able to get away from the Atari line is that there is no affordable, killer, application for the PC in terms of MIDI that I could get that would make the switch worth it.

Running a 16mhz 68000 as I am now is really unsatisfactory, but I am not about to plunk down $1500 for a clone and then have to pay another $300-$1000 to get new software (most of which would be better, but the cost is prohibitive to me...).

For MIDI, I'll probably do better to get a Falcon 030 and change sequencers from Dr. T's KCS Omega to either Cubase or Cubase Audio (which is $800).

The Atari CD-ROM was never actively marketed in the U.S. and to the best of my knowledge, is no longer available anywhere. I know it was available for a limited time in Australia and the UK, but I don't think it's available anywhere now. No matter as better and cheaper CD-ROM units for the Falcon's SCSI-2 port are available from a number of third party vendors now.

> down!
>

Actually, most PC games use 320x240x256. That's what's called MCGA. Standard VGA is 640x480x16 colors. _S_VGA is 640+x480+x256+. That's why 7th Guest is only 640x480x256 (and letterboxed at that!) and is considered SVGA. If someone _really_ went out there and produced some software that took advantage of the number of colors these things could produce, it would be staggering! Of course, they would have to be static pictures. A PC has problems moving a full screen sentence of 128 point fonts accross the screen....

Hmmm. The 68000/16 will probably cost you around $200. And some time to solder it in. Most ST's didn't come w/ socketed Processors. Also, they do _not_ use SIMMS. They use DIP RAM. If you want to use SIMMS, you have to get a RAM board. They are around, what, $100? (Correct me if I'm wrong)

> >It has a 68000. Can I replace that with a 68010 like in an Amiga?

>
> Which manufacturers make ACSI HDs? I read the faq for the st groups
> and it seems like they're saying to go with an adapter and a SCSI
> drive. Which is the best way to go?
>

Okay. What you have to do is get what's called a host adapter. This allows you to controll SCSI hard drives. You have two choices now, you can go with a traditional host, which is a small internal card that you mount in your hard drive case, or the ICD Link, which simply looks like a small adapter that plugs into your DMA/Hard Disk port and comes out standard SCSI. The first is cheaper in the long (and short?) run. You simply get an old PC/XT/AT case. Mount the host adapter in it, and then use the ample room to mount as many SCSI HD mechs you can get your hands on. (You could also just buy pre-packaged HD units, but they ususally aren't a very good deal...) If you go with the Link, which makes for a much more astheticly pleasing setup, just get any Mac/PC/Amiga (!) external SCSI Hard Drive unit and plug it in.

I hope this helps. If you have any more questiong, I'd be happy to help you with them.

Basically, everything is covered by NDA. If you see the information available elsewhere, you can repeat it. If you get information by some means other than one of the documents covered by NDA, then you can repeat it. Otherwise, you can't.

(This is the standard way that NDAs work in the computer industry.)

I've never seen a red "confidential" stamp on any developer docs. If they are starting to put one on, perhaps it's to serve as a reminder.

I know of 2 games that work over MIDI. One is MIDI Maze and the other I think is called MIDI Battle. As for RS-232 the only one I know of is Falcon (F-16 fligh sim.). The first 2 are shareware and Falcon is a commercial product.

The centris 610 4/80 has a street price of $1450 as well as the IIVX 4/80. The
LCIII has a street price of $1250 for the 4/80 config. As a student I can
get the same Centris 610 for $1217.

7443. Re: Falcon Stos cancelled!

Newsgroup: comp.sys.atari.st
Date: 1993-05-24 18:06:19 UTC
From: teh@unix.brighton.ac.uk
Message-ID: <1993May24.180619.16794@unix.brighton.ac.uk>
Source record: 205419

If they do ever get round to doing a Falcos (no chance of atari footing the bill!) I hope it will be a totall re-write, ie not a line number basic.

AMOS is far better than STOS, and I'm not talking about the commands, or anything that an Amoeba owner could claim could not be done on an st, its the basic language an editor of AMOS which are far superior to STOS.

If they changed it into a decent language, ie a procedural basic, or better still, if they based it on 'c' or pascal, cut down and simplified versions of course (hide all the pointers etc!) if reckon they would sell a lot more. Maybe they should get HISoft to market it, they seem to be commited to the Falcon.

7444. The _new_ Falcon lineup!

Newsgroup: comp.sys.atari.st

wrote:
>
> I'm confused. Could someone please post the difference between all the
> Falcon models.
>

Sure, here goes!

The Falcon lineup (as seen by Neuromancer):

1) The Falcon030. Standard 1040 style case w/ squishy keyboard. Nice
machine, but was surpassed by the Falcon II only a year after its
introduction. While still as capable as a standard Falcon030 II, not
nearly as expandable. Can only accept 2 1/2" IDE hard drives internally,
and only has a 1.44 meg Floppy, although this can be expanded to a 2.88
meg.

2) The Falcon II, Home Multimedia Station. This is the Falcon you see almost
every day. Small footprint desktop case. The Processor and DSP are both
on the processor bus that Atari stunned the world with back in 1993.
Taking knowledge from the STT (ST Transputer) and the ATW (Atari Transputer
Workstation), Atari was the first company ever to include _four_ slots,
each capable of holding processor or DSP unit. After its introduction, a
68040 unit was quickly released, giving you the option of starting with a
Falcon040 II, or getting the 040 later and running both in parallel. Also
seen were video production crews using three DSP chips to render 3D
animations in real time. The two VME slots also provided extra
expendability, while keeping compatibility with the excellent, although now
old, CyReL Sunrise cards. While standard Falcon II Units came with 4 megs
of RAM, the eight standard SIMM sockets allow up to eight gigabytes,
although the cost of the RAM prohibits this amount to a most fortunate few.
The multiple bays were also a boon. Although Atari kept the external SCSI
II port of the Falcon I, they added an internal SCSI II connection to
facilitate connections for devices to be stored in the cases five bays.
The standard HMS Falcon II came with an IDE Hard Drive to keep down the
cost, and the now standard Floptical 21 megabyte floppy drive.

3) The Falcon II, Professional Musical Workstation. Atari took a radical step
away from tradition when they introduced this model. Internally identical
to the HMS, Atari answered many skeptics answers to why the Motherboard for
the HMS was in two pieces. But stacking them instead of placing them side
by side, Atari was able to place this machine into a case the size of two
MIDI modules stacked together. Why? What musician _doesn't_ have room for
another MIDI module? The five bays were replaced by only three, one for
the Floptical, one for a 3 1/2" SCSI II hard drive (to facilitate fast

recording) and one 5 1/4" bay used mainly for CD-ROM and CDR (CD Recordable) drives. They keyboard was also unique, having claps build in that enabled it to be attached to almost any keyboard either above or below the unit. This, combined with an extra long monitor and keyboard cable, integrated the musicians workstation for the first time.

4) The Falcon II, Professional Multimedia Workstation. Internally the same to the two units mentioned above, this unit is unique in that is mounts _two_ of the VME/processor/RAM expansion boards, turning this motherboard into a three piece unit. This outrageous expansion capability, inside a tower case with seven bays, produced the most powerful multimedia workstation outside of $20,000+ Silicon Graphics Workstations! For example, AT&T uses a network of four PMmWs with two 68060 processors (each takes two Direct Processor slots to enable 64-bit addressing) and four 56001 DSP chips, all running at 50MHz, to exparament on their new Virtual Reality Interpersonal Communication system, because of their ability to render complex 3D images in real time.

MultiTOS 2.0. This is the operating system used by the Falcon II line, and is available as an upgrade for the Falcon I and TT030 models, although you need to get a special decoder to enable the extra address space required to fit the OS. With a pre-emptive multitasking kernel, along with multi-threading, and symmetric multiprocessor support, all contained in ROMS, very little RAM is needed to use this operating system. With sockets for multiple device drivers and file systems, along with built in network compatibility via the Falcon I and II standard LocalTalk and Falcon II standard Ethernet ports, this gives the Falcon the ability to connect to a variety of platforms. MultiTOS comes standard with T-NIX (Atari's Unix), and NaMFS (Not a Mac File System (comparable to the Macintosh's HFS)) to allow connection to those platforms immediately. Also, NTFS and HPFS (Windows NT and OS/2 2.x, respectively) are available. This system really shines when combined with multiple machines running multiple processors. The network and symmetric multiprocessing are so much a part of the Operating System that on a network composed of Falcon II's, one machine could use the resources of another machine on the network that is not being used. For example, if you were on a network composed of four Falcon II machines each with two 32MHz 68030 processors, and you were the only one there, you would have the processing power of _eight_ 030 processors, with the only limitation that access to the six processors outside your box is limited to Ethernet speeds. Also possible is running multiple copies of the same applications from different Falcons, each linking their data files to a central unit with OLE` 2.0, giving you the power to, say, edit a newspaper while the articles are still coming in.

Well, I hope this answers any questions you might have about the Falcon030 and Falcon II lines. It should be really interesting to see what happens next year.

>these two things, where can I get it, and how much will it cost?

There are several shareware/PD sequencers for the ST. I don't know them so
can't comment on their relative merits, but you might try them all and find out
for yourself. Maybe someone else has any pointers? Check out atari.archive --
they should have quite some stuff.
Commercial sequencers are rather expensive -- typical $500+ -- but at the same
time of course offer more features, flexibility, etc, than the PD stuff. It
all depends on what you want. Most famous are Steinberg's Cubase and C-lab's
Notator, although I myself am a happy SMPTEtrack user (by Hybrid Arts).
Re: samples et al. Do you want to samplew with a sampler and then edit those
samples? In that case I don't think there's too much (if any) decent freeware
around. The real sampling-editing stuff (e.g Avalon, TurboSynth, etc.) is
quite expensive, and a bit tedious to use, since you have to send all the
samples thru MIDI (which is awfully slow).
If you want to sample on the ST.... I dunno -- there are some 8-bit samplers
for the ST, but personally I can't take 8 bits serious. That's all I know :).

>I have a software MAC emulator coming with the machine. Where can I
>get a 68000/16? And how much $$? Also, it takes Mac-style SIMMS,
>right? So which is the best place to get these?

Dunno where you can get the various stuff. I live in the Netherlands, so the
addresses I know would be of litle help, I presume :-).
Uhhm... wadda ya mean, mac-simms??? For the mac-emulator??? Simms are RAM,
and you can't stuff mac-simms in the ST to expand your memory. Various
manufacturers make memory-expansions for the ST though.

>>It has a 68000. Can I replace that with a 68010 like in an Amiga?
>The reason I ask is that I have a spare 68010 sitting in my room...

Can't help on this one. I'm no hardware guy...

>Which manufacturers make ACSI HDs? I read the faq for the st groups
>and it seems like they're saying to go with an adapter and a SCSI
>drive. Which is the best way to go?

Since HDs have become quite cheap lately, your not too dependent on specific
brands. I think I would go for the SCSI & adapter, depending on the price of
such an adapter. Since all machines (except the ST) talk SCSI, your HD will

still be worth something if you ever decide to buy another computer.
An alternative would be a HD which has both SCSI and ACSI busses (like my HD --
but that's a custom built 210 Meg Quantum drive... :-).
Anyhow, don't buy a HD that will soon become too small -- nothing below 60 Meg,
and preferably 100+ (just my opinion, of course).

>Try Cubase 3.0 or Notator. They're GREAT! (And industry standards, no less)

Note: these are *sequencers* only, and thus *not* suited for sample-editing or
recording. And since they're commercial, they're very expensive ($500+).
firts try out the shareware/freeware/PD stuff to see if that suffices. if not,
you can always decide later to spend some $500 on a comercial sequencer.
Never heard of sequencers that were industry standards btw...

I'm curious why you would not choose a Mac for MIDI purposes. We used
to use them at the Columbia-Princeton Electronic Music Center (one
of the most advanced places of its kind) a few years ago and I don't
recall having any problems at all. I'm not sure what they are using
now, but I think they are still Mac based. Haven't all the Dr. T
titles been ported to the Mac?

Cheers,

Chris

P.S. I'm not knocking the pc clone, but the Mac already seems to
have a following in MIDI.

I bought Calligrapher Professional, distributed in the US by CodeHead
Technologies. It is very nice. Many features; vector fonts, thesaurus,
powerful and easy to use rulers, postscript output, and MUCH more. It was
$150, and worth every cent. From what I've seen of Atari Works, it looks
quite good also. It uses SpeedoGDOS, which I really must commend Atari
on. It is fast and easy to use, and not much of a memory hog considering
what it does either. I think Atari Works doesn't use as much memory as
Calligrapher, and it includes a database, spreadsheet, and a lame terminal
program too. There are plenty of reviews of both of these in various
magazines.

>down!

Well this is totally off my point. My argument was that a 486 box
provides a much more powerfull platform than a falcon for the same
price, that is especially true when it comes to graphics. Whether there
is software for it is a seperate issue. I happen to run 386BSD unix on
my 486 box so the full power of my graphics card is used by the X
server.

I really can't believe that everyone thinks 600x480 is good. It's really
basic. If all you want is a games machine then get a SEGA (or SNES I
don't want to start arguing about that), in the UK they're about 130
pounds and falling in price. That's a hell of a lot cheaper than 980
pounds for a falcon.

For a 1000 pounds I expect a serious computing engine, not a toy. The
falcon falls short of the mark when viewed in these terms.

Two other points, I apologise for claiming the falcon only has 8 bit
sampling, I was wrong.

Secondly, in another post someone discussed using a pc with a midi board
instead of a falcon and was concerned about software prices. Well,
CUBASE for windows is the same price as it is for the ST. If you want a
powerfull midi machine, that behaves just like you're old ST but a LOT
faster then I'd get a 486 based system and cubase for windows.

A lot of the comments seemed anti pc but in fact were anti DOS/Windows.
This I can understand but it doesn't change the fact that in terms of
hardware for the price of a falcon you can get a far more powerfull
machine if you go for the 486.

I seem to remember that there is a "Revenge of the Mutant Camels" for the TT. It should be mind-numbing, judging from the quality of the ST version. It is shareware, details contained in the text file included with the ST version (available from atari.archive).

From: boyd@gauss.math.fsu.edu
Message-ID: <C7K5xH.EKn@mailer.cc.fsu.edu>
Source record: 205698

Anybody have any comments about the JRI memory expansion board (the one that takes SIMMS)? I am considering bumping my Mega2ST up to 4mb. I am a bit hesitant to modify my Mega, as I have never had any kind of problem with it (which prompts me to leave it alone). I am primarily interested in hearing if folks began to experience a higher incidence of weird lockups or crashes after installing the JRI upgrade.

Funny, I never felt cramped with 2mb until I began to play with Mac emulation . . .

Thanks in advance for any comments.

Why are people always so ignorant when it comes to ATARI CORPORATION
and ATARI GAMES?

ATARI GAMES lost their lawsuit against Nintendo. This has little place
in this newsgroup since they are both totally different companies.

They only similarity is their name.

If you're not in any hurry, wait a couple of months for AtariWorks. You'll
love it. It's an integrated word processor, spreadsheet, and database
program. For $129, you'll get that plus SpeedoGDOS and a dozen fonts, with
many more only a phone call away.

>1)Can the ST compatible modes ie ST Low,Med,High be used with an SVGA
>monitor, or do I need an sc1224 or multisync that will scan at 15khz
>(I would like to run my old ST software)?

Yes. I use all 3 ST-compatible video modes on my Falcon and an SVGA monitor. That includes programs like Tempus and Cyber Paint which want to see 100%-compatible video modes because they touch screen memory and hardware in extrememly mode-specific ways. Never had a problem. (Of course, these same programs fail to run in the new Falcon modes. Well, Cyber Paint doesn't, it knows how to switch a Falcon to ST Low mode on the fly, but it works equally well on SVGA or TV type monitors.)

I've yet to find software that refuses to run in an ST-compatible mode on a Falcon with an SVGA monitor. (But I haven't tried boot-up-into games like Flight Simulator and stuff.) My SVGA monitor is a NEC 3D clone.

7469. Amiga 500, Atari ST, & NES systems for sale

Newsgroup: comp.sys.atari.st
Date: 1993-05-25 08:03:49 UTC
From: storm@NETSYS.COM
Message-ID: <storm.738317029@netsys.com>
Source record: 205408
Cross-posted to: comp.sys.amiga.marketplace,comp.sys.atari.st,misc.forsale.computers

I have the following for sale:

Amiga 500 Computer w/ 2.04 Roms (keyboard,floppy,etc)
1/2 meg ram (A501) w/ battery backed up clock.
Workbench disks 2.1
Amiga mouse.
Power supply & all cables.
All manuals & original packaging.
Monochrome monitor (Tandy VM-2, Green)

This system is complete everything you need to get started with amiga.
Asking..... $200 for the whole setup. + Shipping.

Amiga Version: PageStream 2.0 w/ all disks & Manuals/box.
Asking..... $75.00 + shipping.

Atari 520STfm Computer /w TOS 1.0, 1 Meg RAM, DD/DS floppy 3.5"
formats/reads/writes standard 720K MSDOS disks.
Manuals & all cables.
Atari SM124 High Resolution Monochrome monitor (640 x 400)
100+ disks w/ various software. (word processors, Dbase, mod players,
terminal programs, games, paint programs, you name it...)

Asking..... $180 + shipping.

I have 2 HP terminals (they have nice little detachable keyboards and
good emulation) I have a manual for these also. They have modem and
printer ports. I used to use all these terminals at one time or
another with a modem to login to my unix account and call a few BBSes.

One is a HP 2621 the other is a HP 125.
I also have an extra keyboard for the HP-125.

I have a Tektronix CT8500 terminal. It has printer and modem ports and
a detachable keyboard. Its emulation is good for unix systems... I
have the manual for it and an extra keyboard.

I also have a Texas Instruments Silent 700 portable printing terminal.
It has an internal acoustic modem (300 baud). Has ports for connecting
a monitor. Uses rolls of thermal paper.(I have 2 full rolls for it)
It is brief case sized. When it is closed up in the case it looks like

a brief case/tool kit or something. Works fine.

Feel free to make an offer...

I have a NES system that I would like to sell, It consists of the
following:
NES Console deck.
2 - NES controllers
Cables to connect to a TV & power supply.
4 Games: MarioBros/Duckhunt, Xevious, & Mario Bros. III.
I have the box & manuals for Xevious.
Asking $50.00 + shipping.

I am looking for any of the following: (buy or trade)

* Amiga bridgeboard (xt or 286).
* Amiga 2000 cards (hard drive controller/ram combo or just a ram
card)
* Hard drive for amiga 2000(actually a Bodega Bay).
* External 14.4K modem.
* Flicker fixer.
* Also maybe a plain external 2400 baud modem.
* Cheap IBM Compat. XT or AT.
* Information on putting a flicker fixer (I or II) in the Bay.
(Manual says to call C.A. I know they will just try to sell me
an adapter or something).
* Accelerator to go in the A500 that is hooked into the Bay.
* Rom switch setup.

Email all offers/questions/information to storm@netsys.com

Cubase for Windows lags far behind the ST/Falcon version. In addition,
the only way to run Cubase Audio on a 486 is to buy the Yamaha CBX-D5
which is 1. Not available yet 2. Cost more than 2000UKP.
Cubase Audio runs on a Falcon without any extra hardware. Well almost,
you do need a rather large SCSI drive.

You should find that versions of Lattice C higher than 5.00.00 can compile to the C++ standard anyway, but I wouldn't think there'd be any problems cross-compiling as long as you've got version 5 of Lattice, which is fully ANSI compatible, and your GNU compiler is ANSI too.

Hope that's of use.
Giles.

Source record: 205420

I've been using DCDesktop happily for years with a mono monitor. Now I want to set up to be able to use a color ST monitor in med-res as well, but cannot figure out how to do this. Can any experienced DCDesktop user out there offer any help on how to set this up?

You see, I want to set up my hard drive so that I can boot up in hi-res, with various auto prgs and other gem prgs on the desktop, AND so that my kids can boot up into med-res, with less auto prgs and different gem prgs on the desktop...ALL FROM THE SAME HD! Try as I might, I can only get the color monitor to boot up in lo-res.

Thanks in advance for help around this problem.

--Gerry
ggreenbe@rodan.acs.syr.edu

PS. I picked up SuperBoot and gave that a try, but couldn't figure out how to get the right results with it, either.

OK. As some people requested it, I repost the bug fix against the crash
happening on the city status display of towns far from the capital,
under an anarchist government:
In the sector 176 of file GAME.PRG, look for the sequence
3F03 3F02 2F39 0006 024E 4EB9 0005 737E 4FEF 0014
then change it to 6000 000E <<<<<<<<<<unchanged>>>>>>>>>> 4FEF 000C
Moreover, someone who phoned Microprose UK told me that they would be
ready to exchange Civilization disks sent to them with a new version,
maybe this week.

7483. Atari STE system for sale

Newsgroup: comp.sys.atari.st
Date: 1993-05-25 12:52:29 UTC
From: imr@cs.bham.ac.uk
Message-ID: <1993May25.135230@cs.bham.ac.uk>
Source record: 205424
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

To enable the purchase of a Falcon030 I am selling my Atari STE system, everything must go! Prices below are rough guestimates only as I have no Atari magazine to hand to see what current prices are... make me an offer!

Hardware:

Atari 520STE With 2Mb memory and TOS 2.06 switchable upgrade - 200 quid
40 Mb Power computing hard drive - ICD adaptor and software - 200 quid
Atari SM124 Mono monitor - 50 quid
Philips CM8833 clone - colour monitor - 100 quid

Software - no prices, just make an offer

NeoDesk 3
Lattice C v3
Hisoft C Interpreter
Degas Elite
Warp 9
GFA Basic 3
GFA Compiler
First word plus
STOS
STOS compiler

Midwinter II
Kick Off II
All 20 odd games that came with it...
Microprose F1GP

Books

Atari ST internals - Abacus
Atari Assembly programming - ZZ Soft - with disk

Miscellaneous

TOS 2.06 chips - suitable for upgrading an STE - these are entirely separate from the above switchable upgrade
Monitor switch box
Nice mouse :)

Well I think thats it at the moment, if anyone wants to make an offer for any of that stuff then just email me.

Ian Rae
Software Engineer
University of Birmingham

Hmmm, yes that would be a nice application. Also one that could be used
at home for controling e.g. the central heating system. But is 50 Khz
enough for all applications. Of course it can't be used as a scope for
electronic circuits. But can there be an external crystal to supply
higher sampling rates to the DA converter? I hope some developers
indeed make some useful educational software for the Falcon. The
machine seems just ideal for it.

>Technologies. It is very nice. Many features; vector fonts, thesaurus,
>powerful and easy to use rulers, postscript output, and MUCH more. It was
>$150, and worth every cent.

The downside of Calligrapher is:
1) It's rather slow -- better on a TT or Falcon
2) PostScript output is pretty buggy, and produces *huge* files. The author refuses to accept there's anything wrong with it.
3) Poor support -- first convince the author there's anything wrong, then convince him that he ought to do something about it. I and others have had many problems getting a satisfactory response.

Personally, I use That's Write V2. It uses GDOS bit-mapped fonts, without GDOS, but can also take advantage of any fonts built into your printer. Fast, multi-window WYSIWYG display with print-preview. Works well under MultiTOS. Excellent support from Compo UK (but I know nothing about the US distributor)

I've used That's Write (V1.5 and V2) to write two large dissertations (17,500 and 33,000 words, respectively) and have been very pleased with the results. I cannot imagine getting either finished if I'd used Calligrapher.

>be extremely simple.
>
>--

Yes. The Overscan driver (OVRSCAN.PRG) is about 30k but only uses 12k of RAM. Other programs just set something and terminate. I have a program in my AUTO folder that sends a setup string to my printer. The file size is about 2k, but once it has terminated, it uses no memory at all.

In general, you are right.

Ofir ogal@cix.compulink.co.uk

The best defense against logic is ignorance.

Both DM and CSB work on the TT, but you must press both the alternate and the number 1, not the numeric keypad 1, when booting to get into the correct resolution. Other than that I use the TT for programming, I kept the ST for games.

|>

You may not need a JRI board. Open your Mega and see if you have one of those
that just require you to add the extra chips, You'll see 16 empty spots next
to your current memory. If this is the case then all you should need to do is
add the chips and the resistors to enable the RAS and CAS lines.

7490. HELP me with The Link :-(

Newsgroup: comp.sys.atari.st
Date: 1993-05-25 14:52:31 UTC
From: mandela@maya.dei.unipd.it
Message-ID: <C7L7zK.4K7@dei.unipd.it>
Source record: 205433

Hi,
I'm in trouble with my hard disk installation.
I've connected an ICD "The Link" interface to my
1040 STE 4Mb trough a dma cable, then a Quantum
LPS hard disk to "The Link" host adapter through
a SCSI cable and a PSU to the HDD. I booted my
system with the ICD utilities disk (6.0.8) in drive A:
But what I can read is only :

NO ICD Host Adapter

And when I run the format PRG or any other Utility
I receive the same answer : icd host adapter not found!!!
I can change the ID number of my HDD and when I boot
I see "0 ID ..." or "2 ID ..." or ...., but
when I scan which devices are connected nothing is found.
I can change STE with STF or a LINK with another or
a dma cable with another but with the same result.
Can anyone help me?

Reply via e-mail if possible.

Thank You Very Much

Off the top of my head, you get 4 MB memory, 65 MB IDE hard drive,
Windowing environment, mouse, 15 pin joystick ports, SCSI II, serial, parallel,
MIDI, DSP, stereo in, stereo out, VGA, Atari Works, SpeedoGDOS, 16 MHz 68030,
processor direct slot, BLiTTER, LAN, 1.44 MB floppy, MultiTOS.

Thats an excellent idea , what about it Hisoft ?
The Falcon and the whole St range needs a language which gives you easy
access to the Graphics/Sound hardware .With over 100000 copies of the
original Stos sold It must be profitable for someone write a Blitz Baisc/Amos
clone for the St?

I've had a JRI SIMM board in my 1987 vintage 1040ST for several years.
I haven't seen any lockups. The only difference I have noticed (other
than having 4 megs :-)) is that you get some interference on the
screen when a lot of data is moving between the computer and the
hard disk - this is due to the removal of the cover of the video
shifter can I think. I've been meaning to shield it with some metal
foil but it is not annoying enough to be worth opening my machine
up again. Installation wasn't bad - a friend of mine who is a
hardware engineer did it :-). You should be good at soldering and
stuff if you want to do it.

When I did it several years ago, 1 meg SIMMs were $39 from the
Chip Merchant in San Diego. I'd imagine they'd be cheaper now.

The LPS drives do not have a jumper for parity (Atari does not use the parity bit). Parity can be set on/off via software ONLY if

1. you have the right version of the LINK software (don't have my docs with me and I cannot remember)

2. the ROM on the Quantum has to be a specific version or higher (again, do not have the docs).

Howard at ICD can give you all the right info (he bailed out one of my clients for me). ICD's FAX # is 815 968-6888.

>is called MIDI Battle. As for RS-232 the only one I know of is Falcon (F-16
>fligh sim.). The first 2 are shareware and Falcon is a commercial product.
>
>Bob
Other things that do this...
Sublogic FS2 : Two player mode via RS232
Stuntcar Racer : REALLY cool two-player race mode! [good game anyway, BTW]
Digital Integration F16 : Two Player Duel Mode - older versions don't
work on STE, but I think the newer budgert one
does.
Gremlin Lotus II : (and III, I think...) II has up to 4 players on two
computers via RS232.
Populous : You each get to be competing gods - RS232

All the above are commercial...

In shareware, there was also another MIDI-linked game on ST Formats
coverdisk recently, called Rayoids. Dunno what it's like, because I
only have one ST at the moment (someones borrowed the other - gah!).

There is a (very) old kindof connect-the-dots game, the name of which
escapes me, that lets you play via RS232, too...

and I hope to be writing a MIDI game before too long, when I have spare
time after these exams :)

hope that helps

>
>

Thanks to one quick and friendly user, I now have what I need.
I saved the desktop.inf of my true-blue mono set-up as
desktop.in1, saved all the desktop information, and then
rebooted from my color monitor.

I booted up without DCDesktop (ctrl-alt at boot up)
into low res due to the desktop.inf at the root director,
which I then erased. Then I switched into med res, set up the
desktop the way I wanted it, and saved this desktop from the
GEM desktop.

I then copied the desktop.inf file from the root into the
dcdesktop folder, where all the necessary files are kept, and
rebooted, this time letting dcdesktop boot. Sure enough, it
came up in med-res with dcdesktop installed and working!

So, I can now boot up in this "general" setup both in med res
and mono...and all it takes to get to my old desktop is alt-1
(on the keypad).

Hope this helps others with a similar situation.

--Gerry

What about GFA BASIC? It was always superior, IMHO, to STOS for writing any application other than games because of it's editor, no line numbers, modular approach, speed, etc. STOS' great capability was in all the specialized sound and graphics functions it had which greatly simplified game creation. You could do the same things in GFA, but it took a _lot_ more work by hand.

What if GFA users had a library of specialized graphics and sound handling features that they could "include" in their own code with a single INLINE command? What if these features included the ability to create and manage several multi-colored sprites as well as collision detection? What if it easily supported horizontal and vertical scrolling? What if it came bundled with a hundred or so DMA and digitized sounds? What if it included an easy-to-use sprite editor? What if... well, you get the idea. Would there be any interest in such a product for STs and Falcons? Hmmmmm???

Just a little market research, folks. :)

The documentation that I have (which is the Falcon addendum to the Atari Developers kit is that preproduction machines have certain differences to them including having only an 8 bit ADC/DAC. It also states that there will be a full 16bit ADC/DAC in the production machines sold to the general public.

Dunno, but when I tried it out, I had to reset the _memtop system variable
to 1MB. This (ie., programs not running in 4MB) often happens with games.

Hi,

I recently sold most of my Atari kit, but the following items remain.

- an Atari monochrome monitor. (50 pounds)
- PC Speed. (50 pounds)
- an assortment of programming books on 68000, GEM, TOS etc, including disk. (L30).

I've some cover disks too, which someone can have for 15 pounds.

Mail me as I'm on leave for the rest of the week.

William.

This ia a pretty active Atari town. There are at least three
stores selling Atari stuff and some other smaller outfits. Chiang
Computers is the most dedicated a nd yiou can bargain with the owner.
He is quite knowledeable and helful. Ali computers sells atari
stuff, but their support and knowledge is minimal. Click Here
Computers is a new and lively outfit, one of whose owners is Tim
Rosenquist (his brother Eric wrote the Stalker/Steno series) and they
can do any custom stuff you want as well as repairs. Tim is very
helpful, and very good as a repairman / customizer.
There is a user group (National capital Atari Users group) which
meets once a month. Interesting people show up as there are some
really good programmers here -- Phil Comeau who wrote GramSlam and
Spelling Sentry lives here, etc.. Tim Rosenquist runs the NCAUG
bulletin board and is always at meetings.

>I have an Atari 520STfm, and was planning on either upgrading

>if I should do the upgrading now or later. (If there are no Atari
>specific stores in Ottawa, I'll have to do the upgrade here.)

You should have no trouble doing any of the above here. A new
Falcon would be my personal choice, but it is a matter of $$ anmd what
you intend to do. I have upgraded all three of my Atari 1040s to 4Mb,
two of them through Tim at Click Here computers.

welcome to Ottawa

That statement is just a little too sweeping. I used to have a
Quantum 105LPS hooked to my TT and it certainly did have a parity jumper and
it worked. If I remember correctly, only the LPS240s did not have the jumper.
The other drives should have one - and it needs to be jumpered (to disable).
Usually the jumper sequence is DP, SS, WS - Disable Parity, Sector Seek (a HD
test mode), Wait to Spin. Make sure that DP is the only one jumpered (of those
three).

7512. Games I hope they port to the TT/Falcon ...

Newsgroup: comp.sys.atari.st
Date: 1993-05-25 22:25:51 UTC
From: baffoni@phakt.usc.edu
Message-ID: <1tu6dfINNqjf@phakt.usc.edu>
Source record: 205448

Hi all,

Does anyone know if there are plans to port these titles to the TT/Falcon? (leaving out the ST/STe is intentional as they take 640x480 res.)

Dune II - I played this the other day. Darn is it addicting! A very neat real-timish simulation of battle on the Planet Arrakis. You can be any one of three battling houses (Atreidi, Harkonnen, and one other), battle the other houses with tanks, Quadbikes, Ornithopters, Rocket launchers. I saw (and played) it on a PC, but I don't remember the software house.

Might and Magic III - Another addicting game. neat graphics (again, I got to play it on the PC).

Guess I'll have to see if the new version of NHack will keep me occupied until I can get something like these... :)

Hey Everyone,

I was wondering if anyone has written a converter that converts from some format (preferably .GIF or .JPG, but I'm not picky - .iff, .lbm, .lbx, tiff, pict, whatever) to .PNT. I have lots of .gifs that I would like to use as a background under Warp9 in my TT screen modes, but the only picture converters I have will only convert to .pc? and .pi? etc. which are only ST resolution file formats.

Does Codehead plan on making other file formats loadable????

-MikeB

Is this fellow deaf, or just totally brain-dead?

640 by *480* is a basic Falcon resolution. Without any additional
hardway, resolutions like *768* by *576* are easily achieved.
Even higher resolutions are possible in software, and higher still
with a very simple hardware addition (just an external clock, basically).

As far as graphics goes, the Falcon is superior to a plain SVGA card
(ie. no accelerator, not localbus), simply because of the FAR greater
throughput to the Falcon's video memory. How many SVGA cards have
4M of RAM on them? 14M?

320x480

All "240" line VGA modes are implemented by line-doubling (ie. actually
480 lines, but every second line is just a hard-ware copy of previous line),
therefore, "240" line modes use just as much resources as 480 line modes.

The only one I know of that is currently available is Prism Paint itself.
In about 2 months, Speed of Light 3.0 will be released, which will rock
the ST/TT/Falcon graphics world... :) It will do the deed you desire.

i heard a while back that someone was doing a remake of ballblazer called masterblazer, but i haven't seen any evidence. i figure this game needs to be done on the st range simply because anything that can drag people from an amiga and get them to crowd around an 800xl has to have something. however, my one fear with this kind of thing is that it will end up looking like st star raiders, which ran slower on my tt than it did on my 800xl.

i mean, if a can't run Spectre (the mac game) on my tt, with this, i wouldn't have reason to complain :P

rutger@csa.bu.edu leave your witty phrases at the door

mjl-b@minster.york.ac.uk writes:

>The downside of Calligrapher is:
>1) It's rather slow -- better on a TT or Falcon

This is a surprise! Of course I do run it on a TT, but I've seen it on several 8 MHz machines, and have been impressed with the speed. I think it's speed is comparable with Speedo GDOS, and much faster than (though not as accurate as) Calamus.

>2) PostScript output is pretty buggy, and produces *huge* files. The author
>refuses to accept there's anything wrong with it.

I have not tried using the PostScript much yet; I'm getting an HP LaserJet 4 this summer though, so I'm sure I'll find out. CodeHead software is supporting it very well in the US. They've made some major changes (including to the postscript driver). It works fine under MultiTOS, and it doesn't need GDOS anymore. I tried the pre-CodeHead version before I bought this, and it was very buggy. I have yet to have a problem with this version.

>3) Poor support -- first convince the author there's anything wrong, then
>convince him that he ought to do something about it. I and others have had
>many problems getting a satisfactory response.

It seems the CodeHeads are allowed to do anything they want to it; I'm happy with the service and with the results of their tinkerings.

>Personally, I use That's Write V2. It uses GDOS bit-mapped fonts, without
>GDOS, but can also take advantage of any fonts built into your printer.
>Fast, multi-window WYSIWYG display with print-preview. Works well under
>MultiTOS. Excellent support from Compo UK (but I know nothing about the US
>distributor)

>I've used That's Write (V1.5 and V2) to write two large dissertations
>(17,500 and 33,000 words, respectively) and have been very pleased with the
>results. I cannot imagine getting either finished if I'd used Calligrapher.

I've heard it's pretty good, but I've never seen it. I've read a few reviews, and I had the impression that Calligrapher had more features.

Wrong, Einstein. Where have you been? The Falcon has 16bit da/ad. And the
Falcon was not designed to be a game machine. You just lost whatever minimal
credibility you had. Into my kill file...

Gosh, Glen... I guess your news mailer never truncates a line if it goes over the max it can handle...

If you actually knew how to read, and could read in context, you'd probably be able to figure out that the trucated word "tha" actually was "that"...

(I know.. it's a difficult concept, but keep at it.. you'll get it some day...)

Anyway... so Atari has finally managed to manipulate itself out of the realm of "penny stocks"... whoopie..!

So now it's back to where it was several years ago..

I guess that's reason for dancing in the streets...

Anyone stupid enough to have bought Atari stock in years past has now regained a few pennies against the losses brought on by superior management.

Like I said... when intelligent investors begin to take notice of Atari as a credible investment and begin to bring the stock price back up to where it has some credibility in the market, we'll both "rant and rave" together...

BobR

>What about GFA BASIC? It was always superior, IMHO, to STOS for writing any
>application other than games because of it's editor, no line numbers, modular
>approach, speed, etc. STOS' great capability was in all the specialized sound
>and graphics functions it had which greatly simplified game creation. You
>could do the same things in GFA, but it took a _lot_ more work by hand.

In Germany, the distributer Richter announces the new (GFA-)Basic 4.0
interpreter is ready now. The compiler will be available at the end of
1993. It seems that the company 'GFA Systemtechnik' doesn't exist any longer,
but a few programmers try to continue the developement of this language.

The new Version will not have a Games-Lib, first of all they try to include
all new GEM-features and finally the Editor will run on any resolution (what
a shocker, eh?). But the most important thing is: GFA-Basic lives!

Ciao, Heiko.

It's possible to display the COMPATIBLE-Modes on VGA/SVGA/ms-monitors (with 60Hz)
|> 2) If I buy a multisync, is it worth getting one that does 15-40khz, or
|> should I not bother with 15khz and get one that does 30-60khz (bearing
|> in mind add-ons such as ScreenBlaster, graphics cards etc which will
|> provide greater resolutions)?

You'd better get one without 15 kHz. Only one programm (CEBIT93.PRG) isn't able to run on a TV (silly thing as ATARI hasn't any RGB-adaptors yet) - all the others only need the compatible screen-memory.
I bought a 17" NoName (AOC735) three weeks ago (30-64kHz .. 50-90Hz but works with 27.5kHz and even with 245Hz too.
And since my default-resolution for CALAMUS is 1024*768 now, or even 1280*960 (with BlowUP030) I really like working with this machine now.

|> 3) What is the chance that after buying an SVGA monitor, most programs
|> are written with TVs in mind and not VGA monitors. How dependent will
|> games and other software be on the screen mode and monitor being used?

If the games are either stupid or very time-critical there might be problem ... but ATARI asked the developers to write flexible enough for both TV and VGA.

|> 4) Will programs like FalconScreen and super78 work on an SVGA monitor?

Super_78 NEEDS a SVGA cause it's the forerunner of BlowUP030

>with a very simple hardware addition (just an external clock, basically).
>

From what I've been told, I admit I haven't seen anything except the
advertising blurb so far, it takes a few tricks to get these higher
resolutions and at the cost of the number of colours displayed. Added to
this is the totally different way of using these higher modes and you've
basically got a nice hack for those programmers who know what they're
doing. With SVGA, you can put your card into as high a mode as it can
and it STILL looks like a SVGA card to the software, you just get higher
resolution graphics out of it.

>As far as graphics goes, the Falcon is superior to a plain SVGA card
>(ie. no accelerator, not localbus), simply because of the FAR greater
>throughput to the Falcon's video memory. How many SVGA cards have
>4M of RAM on them? 14M?

Some but not many, but in any case, this is totally irrelevant. The
hardware on the falcon won't use more than 1M of ram because there's
nothing it could do with any more than that. You only need more ram when
you increase the resolution/no of colours. Virtually all svga cards sold
today come with 1M which will give you 1024x768 @256 colours.

Perhaps you can explain the FAR greater throughut argument a bit more.
Are you saying that the falcon uses CPU memory for graphics? If so then
there are a whole number of other issues, such as bus contention which
would make it a very inefficient implementation.

As an aside, I don't think it's fair for people to keep claiming that
the 486 boxes are XT's. They're not. The falcon is a new machine and
as such should be compared to hardware of equal age and price range.

Therefore we are talking about a 33Mhx 486, with a 1Mb SVGA card and
quite possibly a local bus S3 accelerated card.

7547. Atari ST stuff for sale: Okimate 20 printer, Printmaster Plus S/W

Newsgroup: comp.sys.atari.st
Date: 1993-05-26 16:27:44 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <10103@tekig7.PEN.TEK.COM>
Source record: 205259
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other

Printmaster Plus program for Atari ST $8
Make signs, greeting cards, etc. Works with 9-pin printers and Okimate 20.

Okimate 20 24-pin color printer $30
My kids used this a lot for color screen dumps when they were younger, but they're into DTP now, so I bought a 300 DPI printer. This is the Atari ST version of the printer, which emulates Atari SMM804 graphics (basically Epson 9 pin) as well as doing color screen dumps and 24-pin NLQ text. Included: 2 1/2 black ribbons, 1 1/2 color ribbons, and about 250 sheets of fanfold paper. Doesn't include printer cable, since it uses a standard Centronics cable - about $10 from any computer store. Also, the current print head has one of the 24 pins burned out; new ones cost about $20 by mail order and just snap into place. I'll enclose an order form from the company that sells paper, ribbons, and print heads.

Take both together for $35.

Both of the above come with original boxes and manuals, and I'll pay shipping in the continental U.S. (Extra charge for COD.)

>and it STILL looks like a SVGA card to the software, you just get higher
>resolution graphics out of it.
>

According to all those lucky hackers in Germany with Falcons, the higher
modes act just like you installed a graphics card in the system (note
someone was using Calamus in 1024x768). You just put some sort of driver
software in the auto folder to go along with your little piece of
hardware (or no hardware in some cases), and the OS understands the newer
resolution. If any program calls on the VDI to provide the screen size and
number of colors, it will be fully cooperative and return 837x652x16 or
whatever weird screen size was set up by the driver.

No hacks, no problems for any well-behaved software, just a nice higher
resolution display. The only problem I see is that you _have_ to have
a capable monitor, otherwise this sounds like a real hot item for the
Falcon (anyone want to distribute them in the U.S.? Please?).

Yes, Dave Munsie's GP Graphics Engine has never been commercially released.
It has a lot of capability (as is evidenced by all the cover disk games he
created for ST REVIEW with it) and is even Falcon compatible (in ST res)
but he's not convinced sufficient demand is there to justify giving it up
for his own personal use.

Whoa, that's bound to be a shock to the current GFA employees in the USA branch office that I just spoke to. :) Nah, while it's true that GFA's interest in the Atari market has waned, they are very much much alive thanks to their DOS & Windows products.

As far as Richter is concerned, I hope they DO release a new "GFA" BASIC but the last I heard from CeBit was they still had a lot of legal wrangling to do with GFA Systemtechnik first. Information to the contrary would be appreciated, of course.

Well, at least for my Quantum LP240S this is not true.
It has jumpers SS, EP, WS.
I suppose 'EP' means 'enable parity', and the drive was recognized
as soon as I removed an initially present jumper from that position.

The Falcon does use CPU memory for Video and is very slow at 256 colours.
However, NVDI (software accelerator) speeds up the graphics by a factor
of 2 to 10, depending on what VDI function is used. Text output for
example is 9 times faster.

UUGGHH!!! My Stalker_3.0 program has freaked out and I am hoping someone could offer some useful words.

When I use it as an accessory (which i don't like to do) it works fine (I think).

BUT! When I try to run it as a program I get a message complaining that the resource file , STALKER.RSC is missing. This is crazy since it is right there next to it!

This is actually the latest in a series of bizarre errors/problems I've been getting trying to run this thing since yesterday. Before I would get 2 bombs (bus error I believe) when it ran. Before that I think it was comlaining about memory (which it never did before, and shouldn't have then).

Any suggestions would be greatly appreciated.

There is no C++ from HiSoft, nor am I working on one, if we were working
on one I would be the person in charge of that work! What there is is a C++
front end from Comeau, who have commented on usenet recently (Greg are
you out there?)

>
>Strange ... there's an option in my Lattice C (-c+ or something) which is used
> to:
>
> "Ensure compatibility with the Lattice C++ front-end"

Lattice (the Chicago company who we licensed LC from) had a C++ translator
for the Amiga, it only ever had one version (1.0) and was frankly little
more than a toy (and is now defunct). The -c+ option was a hangover from
that (and IIRC I removed the code from the compiler some time ago...)

] getting trying to run this thing since yesterday. Before I would get 2 b
] (bus error I believe) when it ran. Before that I think it was comlaining
] memory (which it never did before, and shouldn't have then).

Try clean-booting (e.g. no TSR's, ACC's etc) and running it.
Also, if you are getting problems, run a virus checker over the machine,
as there is always the unlikely possibility that a virus can actually
cause in-compatibilities with other software trying to use the same
system traps etc.
Could even be a loose SIMM board if you have any, in which case the
drop-the-ST-onto-the-desk trick might fix it, but it doesn't do the
internals much good otherwise!
It might just be one puny TSR or ACC that doesn't like something else,
so something like X-Boot/Super-boot etc. to try disabling/enabling
certain combinations might help!

(I presume that because you are using STalker you have a hard-drive!)

Why not use a LIBRARY! All this talk of inventing new languages to
suit tiny little markets drives me crazy. Write a decent library
in a proper language, and be done with it!

No ex-STOS programmer is going to get a job writing STOS programs, are
they - so learn a real language, use a library for that language, and
give yourself some job opportunities.

I don't really care if it is C++, C, Modula-2, Modula-3, LISP, Pascal,
or whatever.

Libraries are the solution. Not new languages whenever your field
changes.

(I'm talking to everyone, not Tom in particular)

Actually, the thing I find most annoying about Warp9's custom-desktop-picture feature is that the picture must fill the whole screen. There is no reason why they couldn't allow a smaller picture to be loaded, and have it positioned at some point on the screen, with the rest of the screen plain (or patterned I guess - if you go for that sort of thing).

The reason is that a TTmedium screen takes 150K. That's a LOT of memory just to have a background-pic! Besides, I don't want the picture over at the sides underneath my icons - I want it in the middle of the screen where I normally open up a window.

Also useful would be a tiling mode - allow any image to tile/tesselate to fill the screen. That way, you could use some of the gorgeous wood-grain GIFs that are available - nice and soothing to the eyes.

7571. uEmacs 3.12

Newsgroup: comp.sys.atari.st
Date: 1993-05-27 03:19:06 UTC
From: cburke@nexus.yorku.ca
Message-ID: <cburke.738472746@yorku.ca>
Source record: 205282
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

MicroEmacs 3.12 has been out for about a month now (you can get the source all over the net as ue312dev.zip, for example from von-neum.uni-muenster.de in the directory /pub/Micros/Micro-Emacs), but I can't find a compiled version for the ST. Has somebody got one? If so, can you upload it someplace?

This is a bit urgent, because the version of 3.11 available on atari.archive and elsewhere has a very bad bug: if you try to save a file onto a full disk, it bombs.

Thanks,

The PLI CD-ROM unit is now already in distribution. Since it is specifically
designed for use with a SCSI II port, it will require an ICD Link in order
to work on ST machines. It is capable of data, audio AND PhotoCD, so
(of course...) it's not gonna be cheap. But it IS available NOW.

Warwick Allison was working on a GEM-based graphical NetHack (get out
those TTs and Falcons so you'll have a useful screen size at 16
colours!), I was going to add sound support if I had time...

Unfortunately, I haven't had time. I'll have to discuss things a bit
with Warwick, since I was using his code to create sounds... ;-) I
might be able to add the bits and he can incorporate it into his GEM
NetHack build.

Isn't being a dealer and getting screwed by Atari over and over again
just wonderful? No wonder there are no dealers around here...

Am I the only one who's noticed the lack of Falcon040 information?
OVER A YEAR before the Falcon030 was announced, _full_ specs were being
posted to the 'net (too bad they left the 16-bit bus out of there). So,
if we take that example as "typical" for new Atari products, the
Falcon040 is WELL over a year away. Hmm, PowerPC chips should be cheap
and plentiful over a year from now. Well, at least they'll be
available, unlike the Falcon040...

Sure, we had a couple of messages about developers who had Falcon040 on
their resume's _months_ ago, well before even the first "Falcon030
availability" date. Atari's made no moves to provide us with a faster
machine, even something easy like a 33Mhz '030 machine.

Is the 16Mhz Falcon030 even available in Canada yet? It's almost June
(what, 8 months after "Falcon030's will be avilable in Oct/92!").

> I was wondering if anybody was interested in maybe drafting a letter for

Don't join the MS heard, get OS/2... 2.1 is due June 14th, and RULEZ,
D00D. If you don't like it for some reason, at least you'll have a real
nice machine for running Windoze.

OK, not for serious work. But for games it is useable! Remember the
old C64? Nearly all games used the resolution of 160x200 and looked
quite good...

But I believe most games will run in 320x200 TrueColor-Mode...

If all you've done is read a few bits of advertising, what makes you think
you're any kind of expert?

>Added to
>this is the totally different way of using these higher modes

Was this bullshit in the advertising too? The VDI in the Falcon is
quite capable of handling quite a few different modes, I think you
will find...

>With SVGA, you can put your card into as high a mode as it can
>and it STILL looks like a SVGA card to the software, you just get higher
>resolution graphics out of it.

Just as all Falcon graphics modes will still look like VDI to
GEM applications.

>>As far as graphics goes, the Falcon is superior to a plain SVGA card
>>(ie. no accelerator, not localbus), simply because of the FAR greater
>>throughput to the Falcon's video memory. How many SVGA cards have
>>4M of RAM on them? 14M?

>Some but not many, but in any case, this is totally irrelevant. The
>hardware on the falcon won't use more than 1M of ram because there's
>nothing it could do with any more than that.

Here's a very simple use:

Use double-buffered TrueColor 640x480.

That uses: 2 * 640 * 480 * 2 bytes = 1200Kbytes.

>you increase the resolution/no of colours. Virtually all svga cards sold
>today come with 1M which will give you 1024x768 @256 colours.

Not to mention that all these VGA, etc cards also have to find space
in that 1M for the graphics to transfer TO the screen if it is to
operate at high speed.

>Perhaps you can explain the FAR greater throughut argument a bit more.

An animation using delta-frame animation (which is very prone to large
differences in redraw-times for each frame) could use 10 600K frame buffers
if that suited the application.

>The falcon is a new machine and as such should be compared to hardware
>of equal age and price range. Therefore we are talking about a 33Mhx
>486, with a 1Mb SVGA card and quite possibly a local bus S3
>accelerated card.

Why compare anything? Why don't you take your 33MHx (that's 33 million
hacks applied to an 8088 chip) and just move along through the door
on your right.

Sorry everyone. I'll take this to advocacy.

From: beave@hardy.u.washington.edu
Message-ID: <1u1narINN519@news.u.washington.edu>
Source record: 205260

Due to continued requests for the Space Invaders clone I offered I thought it best that I post once again to inform anyone interested that it is available on atari.archive, or atleast should be soon. I am sorry if this is a problem for anyone, but many problems with my mail program not working on the other end and various bounced mail problems to boot I am not able to continue mailing it. Thanks for understanding and I hope you are able to play the game soon if you don't have it already. Again, my apologies!

Let's not forget that now that some people have discovered how flexible the Falcon030's VIDEL is, there can be practically *any* resolution one wants (on Multiscan monitors) within some boundaries, and I wouldn't be surprised if resolutions like 480x360 in TrueColour mode were used in games...

7587. Hooking a CD-ROM to my Mega 4 ST

Newsgroup: comp.sys.atari.st
Date: 1993-05-27 09:22:34 UTC
From: ralph@cerfacs.fr
Message-ID: <RALPH.93May27092234@hal.cerfacs.fr>
Source record: 205287
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have recently gotten a SCSI CD-ROM at the Computer Shopper in
London, UK. I vaguely remember that there were problems between Atari
software and modern CD-ROMs. And I seem to have a problem with mine]
My Mega 4 does not see the CD-ROM. Nevertheless, ICD's IDCHECK does
successfully communicate with it:

TOSHIBA CD-ROM XM-3401TA

So, I believe that it is correctly hooked up. I am using ICD Pro BOOT
6.0.8 together with MetaDOS 2. For these tests it is my *only* SCSI
device.

Any suggestions, anyone? I am currently at a loss.

Thanks,

My screen blanker, ST Blank (plus plug), attempts to use as little memory as
possible by overlaying its data areas with its initialisation code. After
all, once the installation is over the initialisation code isn't required
any more.

After initialisation, all that's left in memory are the various interrupt
and TRAP handlers and the buffers. If it weren't for the fact that ST Blank
needs to allocate a screenful of memory, it would take up less memory in the
machine than it requires on disk.

>reviews, and I had the impression that Calligrapher had more features.

It depends on what sort of documents you write. Calligrapher is good for short, intricate documents with many different sizes and styles of text, fiddly layouts, many pictures etc. That's Write is oriented to long documents that have to look good but also be *consistent* -- that's the sort of thing I write.

Hi!

Seeing as the thread seems to have tailed off now - I thought I'd post the summary I mentioned at the beginning... this is a list of the games that were mentioned - multiple votes are marked, and I have added any extra information that may be useful, where I can.

2 Galaxian {Sinister Developments have done this one recently }
2 Tempest {Tricky because of the controller...}
2 Missile Command
Phoenix
Risk {This one was done as PD for the ST, but subsequently withdrawn after complaints/legal threats from Parker Bros. who make the original board game. There are still versions available for other machines. Notably EGARisk on the PC, and a nice Mac one (or so I am told) }
Sinistar
Impossible Mission {Martin Frederiksen rightly points out that there *is* an ST version of this - but it is really awful. It is. It sucks. Lots. }
2 Manic Miner {Supposedly this was done, by someone for the ST and the Amiga, not too long ago, with revamped graphics, and a 'classic' mode, too, but I have never seen any review or mention of it}
Jet Set Willy
Herberts Dummy Run
Thing on a Spring
Hungry Horace {a clone of a pacman rip?? dear dear... :) }
2 Horace Goes Skiing
Horace & the Spiders
"Any Monty Mole"
Lunar Jetman
2 Skool Daze
Back to School
Rebel Star
Sabre Wulf
Nether Earth
Enigma Force
2 M.U.L.E
HERO
4 Ballblazer {This is available - just. I have it. It is called Masterblazer on the ST, by Activision, and it is quite nice - with a lot of extra frills and things - nice music too! :) I got mine for 3 quid - a bargain.}
3 Frogger {seriously? :) }

Neuromancer
Armor Alley
2 Lords Of Midnight
Tron/Lightcycles{There are *Several* of these (!) but they do all lack
that certain something...}
Eidolon
Operation Nexus
Pitstop II {Lotus I is very similar - and probably out on budget by
now... combine two threads by getting Lotus II, and
have a comms-link game too! :) }
2 Space Taxi
Way of the Exploding Fist {done to death since, but it was a good one}
Ace II
Pole Position
4 Archon { There may already be one, by EA...}
StarCon II
Racing Destruction Set {I loved this - except for the tape-load! }
Mazogs {and this one :) dunno how well it would go these days..}
Omega Race
Galaga
Pengo {I have this on a disk - presumably I got it from
atari.archive some time ago - a bit crusty though}
Encounter {There is Backlash, by Paul Woakes (Encounter's programmer)
which is similar - I never really played Encounter much. I
got this one for 3 quid too... }
Rescue on Fractalus
Trashman { I saw the speccy version - there was also a sequel
"Travels with Trashman" but it wasn't as good...}
Frantic Freddy
2 Trans Am
Montezuma's Revenge
Phantom of the Asteroid
Mr Do! { YES!!!! I have started on this - but I haven't quite
figured it out yet - I have the c64 version to work with
and the XMrIs source (xmris 3.0 is the thing to look for,
if you want it - quite impressive!). The sequel, (or one
of them), was done on the ST, called Do Run Run, and it
is diabolical. I paid 3 quid for that too, but I regretted
it....}
2 Seven Cities of Gold
Ant Attack { Got half an Ant Attack too - disk corruption and a loss of
interest stopped that... }
Cosmic Balance II
2 Aztec Challenge
Black Magic
2 Stellar 7
2 Great Giana Sisters
Jumpman
Gyrus
Castles of Dr Creep

2 Penetrator {see Hungry Horace :) }
The Sentinel { this is available for the ST. but the music (those
funny little chords) isn't as good as the c64 version!}
Skyfox
Choplifter
Centipede { Sinister Developments have done this. I personally still
prefer the CBM version I have, from years ago...}
Pacman { if you really want one - and this is kind of dubious,
I think HacMan II is probably still floating around.
Dave Bagget probably won't like me saying this one bit...
It *is* a very nice version though...}
Fort Apocalypse

and there you have it!

From the list, you can see that someone who manages to do a decent Archon-style game (not a clone, of course), would do very nicely. I don't know why - I have never seen Archon. Or MULE, which is another name that *always* comes up when old fogeys crowd around the fire talking about old games.

Ballblazer is popular, and if anyone can find somewhere that still has a few copies of Masterblazer , I'm sure people here would be grateful to hear about it.

The games I am looking at doing are Trans Am, and Back to School...
Trans Am, we feel we can improve and alter enough to be able to do -
a MIDI-linked version, allowing a 'duel' type of play, and moving to
Europe, are two changes we have already - obviously improved graphics
are another.

Back To School is really so unique, that to alter it would change it's flavour too much, so I am going to try and contact the author. I have this game at home somewhere, but at the moment I can't even remember the guy's name... does anyone know anything about him that might help us?

Another is RDS, which I loved on the 64, but really needed more memory and fast disks to be playable - if I can (a) work out how it works, and (b) get hold of the original tape version, I am interested in this, too...

Anyone else fancy taking something from the list?

Thanks to all who contributed,

Howie

Ooops, the former entries disappeared.

But I'd like to contribute to all these old goodies games category:

Ports of Call or a similar game.

A REAL Kick Off, not that icky field in the background.

(We are DEEP into games that allow a lot of players to co-play and interact,
something which will be GREAT on Falcon, not on any PC 66MHz or whatever).

Niklas Danvind

a true freak in some areas.

I agree with your point, I my self programm in C, I can't stand STOS or AMOS, and I would dearly love to find some decent libraries for sound and graphics.

I how ever enjoy programming for programmings sake, I also wouldn't mind a job programming!

There are however lots of people who don't want to program. They want to be able to muck around with sound and animation etc. But if you use an animation package, for example, you are very restricted, often to the extent of having to view those animations with in that package. If you wish to go a little further and produce, say a game for example, or even just a demo, you really need a programming language, but learning c, especially off your own back, is not that easy!

AMOS/STOS type languages are a good compromise for those who don't want/need to learn a real programming language.

Sorry about the inept way I have just put this argument, but I'm in a hurry.

HELP....

Atari Archive...

I have the INDEX from A.A. but I am unable to work out
the Directory Paths of this File...

Applications Dtp Fonts pagestream: chancery.arc

Is it possible to have a better INDEX on A.A. one that lists/shows the Directory
paths correctly..

The way I read this INDEX, that the files is in

Applications/Dtp/Fonts/pagestream/chancery.arc..

But that is incorrect....???

Thanks...........

Roger.................. sheppard_r@kosmos.wcc.govt.nz

The last version I released is on atari.archive as hacmn215.arc. It should run on TT's and Falcons too. If people download it, play it, and like it ... great! I certainly don't mind anyone telling people about it; it's there to be played.

BTW, for those who may be wondering, there's no danger in having the game on your hard drive or archive site. Atari never demanded that I stop distributing it, they just threatened (vaguely) to sue me for something or other. They weren't too clear on what. If they decide to firm up their allegations and demand that I chase down copies of the thing, you'll certainly hear about it, so never fear. :)

>From the list, you can see that someone who manages to do a decent Archon-style

>never seen Archon. Or MULE, which is another name that *always* comes up
>when old fogeys crowd around the fire talking about old games.

Some friends and I did some work on an Archon clone, including redoing all the art for 16 colors/320x200 and figuring out the (simple) AI and internals of the original, down to timing the shot regain times of all the different creatues.

We called Electronic Arts and asked them if they wanted a port to the Atari and they told us that there were no plans to port Archon or any other EA game to the ST. This was back in 1986 or so. We didn't ask them if we could release it for free. (Perhaps something they said dissuaded us from that; I don't really remember.)

As for M.U.L.E., the game is still "active" in some sense, since a Nintendo version recently came out. There have been stubborn rumors that Dan Bunten is developing "MULE 2000" for the PC now. (Funny how at one time putting 2000 after the name made it sound really futuristic; now it could just be the release date.)

Anyway, I seriously considered doing an Atari ST MULE port (even using the 4-joystick adapter for head-to-head play), and found out that Dan was *reputed* to be willing to allow ports for a percentage of the royalties. So if anyone wants to do a MULE port, you probably can, and you may even be able to get the original code to work from. Heck, if Dan has the rights himself you can probably sell it commercially.

MULE is a really amazing game. I'd have to say that I think it's probably the most well-designed computer game written to date. The blend of simple playability and emergent complexity makes four-player MULE a truly unique experience. It's worth buying an Atari 800 and MULE cartridge from Toad Computers for $50 or so just to try it.

Dave Baggett

>Thanks for any info!

I do not know of any, but there are workarounds, depending on your setup.

If you have lots of memory, I think the best solution will be to get MiNT and the MiNT aware emacs and run scheme through that. Lots of memory is at least 2 mega, I think. Emacs can run in 1Mb, but I doubt that you can squeze both MiNT and scheme in too, and you need MiNT to have multiple processes.

In less memory, or if you do not like emacs (silly you :-), I would recommend something like getting tempus or jove and a decent shell with job-control (such as tcsh), and keep both the editor and scheme running, suspending one with ^Z, and resuming the other with the fg command. More bother, but better than having to restart scheme and the editor on every fix. Jove may even have some ability built-in. I just recently found out accidentily (dont use it much myself) that it has some compilation support, so perhaps some clever Makefile hacking can help automate the process the start/resume-load-evaluate cycle.

The easiest way to get MiNT, is to get the distribution kit. It is really nice and automated, and I highly recommend it whatever solution you may find.

This is very true, it is amazing how many people have trouble learning c without
and real expreiance of a procedureal lanuguage. Even some who seem competant in
one seem to have real trouble transfering there skills to c. This has always
baffled me I suppose c is not heavilly typed and will let you get away with
alot, ie: the compiler lets you get away with alot and if the syntax is correct
then comilation is usually succssful.
on the other hand 'basic' type programming lanugages are easy to understand and
use.

sorry about the spelling, I'm just crap at it !!!

7604. Damaged Mega STe...

Newsgroup: comp.sys.atari.st
Date: 1993-05-27 16:29:11 UTC
From: nino@vmars.tuwien.ac.at
Message-ID: <1993May27.162911.29758@email.tuwien.ac.at>
Source record: 205283

My Mega STe broke down about 4 months ago, and I haven't managed to find anyone who could fix it. I live in Vienna, and have tried the supposedly `best' Atari Dealer here ("Digi-Shop"), but I was told they couldn't find what the problem was, and that I should get a new motherboard from Atari. Atari Austria has been unable to provide me with one yet for all that time, so I'm looking for an alternative solution. So, the question is:

Who knows where to get a Mega STe motherboard, or where to get a Mega STe fixed (near Austria?). The Mega STe does nothing when switched on, sometimes when it hasn't been switched on for a while it draws a screen full of bombs (horizontally). I wouldn't be asking for help here on Usenet, but it seems that Atari Austria are unable to provide any customer support, or even support for registered developers (I am one). I'd like to hear some Atari employee's opinions about that by the way...

Sorry for wasting your time & bandwith!

Regards,
Marinos Yannikos (nino@vmars.tuwien.ac.at)

PS: Any help/hint is welcome...

7608. Falcons in end users hands??

Newsgroup: comp.sys.atari.st
Date: 1993-05-27 18:06:17 UTC
From: de500@cleveland.Freenet.Edu
Message-ID: <1u2vup$8ak@usenet.INS.CWRU.Edu>
Source record: 205288

So Atari is now shipping machines to dealers for sale! How many are they shipping. I hear that a dealer is lucky if they just get one machine! What's going to happen with those dealers that have 20 or more machines prepaid. I guess people will have to wait a few months. We want our Falcons now!! No we wanted them yesterday...

>The LPS drives do not have a jumper for parity (Atari does not use the
>parity bit). Parity can be set on/off via software ONLY if

Nonsense. The LPS drives do have a parity jumper (labelled EP). The Quantum ELS drives do not.

The problem with the non-recognized The Link might be gone once the EP jumper is removed from the drive.

Try Applications/Dtp/Fonts/Pagestream/chancery.arc
^
I requested (and received) this file last week. What I have found out
about the index, is that you must capitalize all directories and
subdirectories, while leaving files lower case.

Fun, huh ?? :-)

7614. RDE Version_4 (sent to a.a.) can remove ramdisks in ANY order.

Newsgroup: comp.sys.atari.st
Date: 1993-05-27 19:58:52 UTC
From: wabe@ukc.ac.uk

RDE (Version_4) - Significant upgrade on RDE_Version_3.
~~~~~~

(Distribution to the Public Domain

by kind permission of

Mark Williams Company)

Hot on the heels of my last submission of RDE (Version_3), comes Version_4 with the very significant upgrade that loaded RDE/RDY ramdisks can now be removed (dropped) IN ANY ORDER WHATSOEVER. The restriction of "Last in First Out" that ALL previous versions of RDE/RDY have had is now lifted. Otherwise this has ALL the features of Version_3 and is FULLY compatible with all previous RDE/RDY ramdisks and saved ramdisk files. Unlike Version_3, I've packed RDE Version_4 with the ICE (v_2.4) packer which is MINT-compatible. You can unpack it with Marinos Yannikos' NAUGHTY unpacker if you like.

Why did I submit Version_3 a week or so ago if I was working on this? Well, I WASN'T WORKING ON IT! - and the idea only occurred after the latter was submitted. I was also led to believe that this could not be done within TOS - but I persevered out of interest. After finding out by "trial and error" about OEM cruft links and the way TOS boots-up its hard disk partitions I finally could see how this (very desirable) feature could be incorporated. For those who prefer to have as much RAM as possible and work with utilities installed on RDE ramdisks (like me!) this will make life much easier.

For example, I could be writing a paper within my SIGNUM2 ramdisk when I find I need to finalise some data analysis with Fortran. So I wish to load my RDE FORTRAN installation but, da*?*n it, I had forgotten to remove that CALAMUS ramdisk installation I was previously working with BEFORE loading the SIGNUM2 one and now there is no room for the FORTRAN one as well on my 4 Mbyte machine. With Version_4 it becomes possible to get rid of that CALAMUS ramdisk I've finished with to make room to load the FORTRAN without disturbing the SIGNUM2 installation at all (Of course - there will be a warm reset - so you must save your document to file on the ramdisk first - come to think of it you'd HAVE TO anyway with SIGNUM2 as it does not allow the execution of external programs from within itself.

I'm sure that other RDE users can see similar benefits. This now makes me extremely envious of Falconers and TT'ers with 32 Mbytes or so. (Thanks to Ofir Gal who has verified that Version_3 works OK on a Falcon.) They could install huge applications (given that Version_3 removed the bug
~~~~~~

that previously had limited RDY ramdisks to no bigger than about 2036 kb) or a huge number of smaller applications simultaneously. I must get one of those Falcons..... but with Maximum RAM as a PREREQUISITE so that I can defragment whole Hardisk Partitions (<= 16 Mbytes) in safety on a huge suitably configured RDE ramdisk in a few seconds (minutes?) only. The only risk is in "sector copying" the defragmented ramdisk (with DFT.TOS) back to the Hardisk Partition. But this should be QUICK (few seconds) and you'd have to be unlucky indeed for the electricity supply to fail during that time!!

My apologies to the archivists for bothering them again so soon after Version_3 was downloaded. But I guess they must be used to this phenomenon for I know of few authors who can discipline their minds not to continue thinking about the task that's occupied a hefty % of their "thinking time" for the previous few days - so if further good ideas occur to them....!! I guess this must be a phenomenon well-known to software archivists & justifies an appropriate "delay-time" before submissions are archived that sometimes annoys "over-keen" authors.

For the curious, RDE ramdisks install themselves at the top of memory and decrement PHYSTOP to allow space. Removing a previously loaded ramdisk leaves the "stack" fragmented - and it is necessary to pull its tail up to fill the gap. However you must do this in a way that TOS will not complain about and plunge your machine into utter darkness out of which re-birth (i.e. a cold boot) is the only solution. This involves monitoring the values of several "vectors" held within RDE's bootsectors to take into account the ensuing change of addresses of the routines these vectors point to as well as altering in a different way the cruft-link pointers that RDE uses to "find" its disks etc. etc. Anyway now I've got the sums right - the whole operation happens usually within about a second and reliably.

There are a few minor quirks. If you remove your "booting" ramdisk then, after a warm reset, booting defaults to A:\ (all this assumes you do NOT make your Hardisk (if any) self-booting from C:\ - Rather Harddisks MUST be woken up AFTER the ramdisks have loaded - preferably from a prog. such as AHDI in the AUTO folder of a "booting" RDE ramdisk (see IQ_BOOT the intelligent booting sourcecode for a tailored booting program that I sent with Version_2 of RDE last year). If subsequently you reload your booting ramdisk off A:\ you will get a normal "loading" warm reset usually followed (at least with ICD Harddisks) by another warmreset after which your booting ramdisk will take over control. There is nothing to worry about in this - it is normal and your data should be intact. HAVING SAID THAT I EMPHASIZE THAT NEITHER I (nor Mark Williams Co. who developed the original RDY) CAN BE RESPONSIBLE FOR ANY LOSS OF DATA, ACCIDENTS ETC. THAT MIGHT ENSUE FROM THE USE OF THIS SOFTWARE. THIS SOFTWARE IS NEW! AND, AS SUCH, SHOULD BE TREATED WITH CARE (but it's passed all my tests so far - wabe).

W. Alan B. Evans.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Has anyone ever compiled Taipan for the ST??

Thinking it was the same "Taipan" that was released for the Apple2 family
a looooooong time ago, I bought a PD (or was it Shareware) disk with the game
"Taipan" on it (This was at ACE in Toronto last year - off TAF, I'm sure).
However, the proggy was in GFA Basic so I couldn't play it (bah!)...
Anyway, having gotten a PD version of GFA (off a STformat CoverDisk) for the
express reason of compiling the blimmin game, I was knackered when it didn't
compile at all!!!

Can anyone help me out here? If it's okay, I'll even post up the source....
if any of you want to have a go at compiling it! :)

Posting's or e-mail appreciated.

Vaya con Dios,
AcEzE.

What are your settings in your config.sys file? (bet most of you never thought you'd here that in reference to an Atari!) Make sure that the hardware driver points to the SCSI address of your CD drive, and the software driver points to the hardware driver. It's a messy file but it works. Also make sure that you are using the hardware driver from ICD not Atari. The Atari driver has some problems with brands other than Chinon and Sony.

I can switch my CD-Rom, Chinon 431, from my SCSI to my DMA port this weekend, and get back to you with the results. I'll send you a copy of my config.sys.

>logging onto the internet?

I'm working on one, (plug plug), it'll be able to do quite a bit of what you
want with out a unix-side server. But if you can compile the server portion
of it, it will allow multiple shells, and background downloading.

The server won't really be a problem to compile (unzoo and make) but I'm
not sure of all of the various systems out there. (VMS for example)

It will include an editor, It will use the clipboard, it'll have an adress
book, A FTP directory, etc etc.. and many more secret features :)

There will also be a BBS version that will allow for us with BBS'es,
Genie and delphi.

Going by Canadian prices anyway, the Mac Centris 610 and IIvx are quite a
few hundred bucks above the Falcon range. A great Mac in the same price
range is the LC3. You can also currently get good deals on the (I believe
now discontinued) IIvi, if you want the built-in CD-rom.

7620. *** Would Like Info/Recommendations for TOS Upgrade ***

Newsgroup: comp.sys.atari.st
Date: 1993-05-27 22:38:57 UTC
From: M14563@mwvm.mitre.org
Message-ID: <16BDB10641.M14563@mwvm.mitre.org>
Source record: 205298

Hello,

I am a fairly new Atari user and am interested in upgrading my 4MB 1040STe
from TOS 1.0 (1985) to a more recent version. First, I would like to knowif
any one knows the release dates and release numbers of the available versions
of TOS. Second, I would like to know if anyone can recommend a version
of TOS to upgrade to. (By the way, I borrowed a 1MB 1040STf from a friend
which had a TOS date that was more recent than mine, (Under Desktop info,
the TOS dates were 1986, 1987 -- I am assuming these dates correspond to
a given version of TOS; please advise). I noticed that I could run a certain
game(s) on his machine that would not work on mine. I know that this could
be due to the fact that the game can not run on a 4MB machine, (one game is
SDI and it *bombs* (2) very early in the game on a consistent basis) but since
I am running my machine under TOS 1.0, I thought that it would probably be
beneficial to go ahead and upgrade the TOS to a more recent version and then
clasp my hands and hope that games/software that could not run previously
on my machine would run under the new version. (Oh, one other thing...
SDI will not run on my machine even if a RAMDISK has been defined.))

So, if anyone could give me a list of release dates and the corresponding TOS
version numbers and/or recommendations for a stable, reliable TOS version to
upgrade to I would be *most* appreciative. 8-) You may thread your responses
to this posting, (which I would *prefer* in the long run) or you may send
responses directly to me at:

etcoles@mwvm.mitre.org

Thank you so very much for any and all help! Take care and God bless!
Ciao! 8-)

The CEBIT93 Demo works fine on TV if you plug the SM124(etc.) adapter
into the monitor port as dummy. The programmers of CEBIT93 were just too
silly to ask for the TV - maybe they didn't know TV is nearly the same
as RGB.

The SM124 adapter is available here in Munich for DM 30 (~US$20).

>It will convert most ST formats and also does Mac Paint PICT format !

I always thought every Atari user has GUCK 1.8 installed. Doesn't seem
so.

GUCK is a very fast Fileviewer for the desktop. If you double-klick on
any non-executable file it will allow you to browse through the file
with both mousebuttons (up/down). Pressing both mousebuttons will exit
the viewer. 'p' prints the file via the wordplus printer driver. 'f'
searches for text.
If a picture is detected (IMG, GEM, PI?, PAC) it will be shown. If you
get a big IMG you can move through the image with the mouse(!) very
fast. You can save the picture as a PI? if you want.
GUCK does not need *any* memory because it's called if you double-klick
on the file. GUCK is installed in the desktop.inf/newdesk.inf. GUCK
works on all ST/STE/TT/FALCON without MultiTOS.

>features, you might need a shell, and toswin.acc (or stuff like that: e.g.
>mw ...). It might also be a good idea to ftp a copy of the mintutils which
>were posted once with the MiNT0.95-release.

You will need the MiNT-Libraries (mntolbnn.zoo and mntincnn.zoo; nn=30
now). You will need xstrip.ttp from the archive utlbin33.zoo. And you
will need prgflags.ttp(prg) from Atari. The actual version of 'make' is
3.63 (Atari PL2!). Edit the makefile and look for '-DONLY030 and
'-DMULTITOS'. Then you can type make without an error.

If you want to use the mintultils you should recompile them with the PL30
Libraries. If you want to recompile 'top.ttp', you have to compile the
curses from the archive 'mntlibnn.zoo'.

BTW: Is it possible to compile the MiNT Libraries under plain TOS?

7628. Has anyone gotten XYZ202B to work right under Mint1.04?

Newsgroup: comp.sys.atari.st
Date: 1993-05-28 01:31:05 UTC
From: mbaffoni@skat.usc.edu
Message-ID: <1u3q0p$bg0@skat.usc.edu>
Source record: 205301

Hi all,

I was running XYZ202B under MiNT1.04 and, although it works, it hogs the machines resources so much (at 2400bps) that it is impossible to open windows or even get at the control panel to use the Mint controller to change Nice levels. Is this normal behavior for just running XYZ202b with out any change to its nice level (I run it from CoNnect)? I notice that when I run it from normal TOS (no MiNT) the progress update is quick, whereas under MiNT, it updates the screen every 20-30 secs by quickly writing all the screen output it missed, then goes back to looking "locked up" then it does a screen catchup again.

This isn't a big problem as I can just boot without MiNT and run it, I was just curious.

Thanks,

MikeB

>> ^^^^^^^
>> ^^^^^^^
>> ^^^^^^^
>> 320x480

>That's true, but it's not really a usable resolution in my opinion.

320x200 was used by thousands of ST games with no problem.

If you're saying the aspect ratio is the problem (which I guess you must,
since you suggested 320x240 was useful), then consider that all an application
needs to do is have X-coordinates (or double Y coordinates), and give
graphics elements a 1:2 aspect ratio, and everything is sweet again.

The biggest drawback of 320x480 mode is the "320" - that's only 40 columns
of 8-pixel-wide-font text.

Check out the difference between 320x240 pictures and 320x480 pictures -
I've done this with TT-low (320x480x256), and the 480 lines makes all
the difference.

Anyway, the fact remains that "SVGA can only do 320*480 in true colour."

Whoever programmed Xyz.ttp stuck the darn thing in supervisor mode!
Supervisor mode doesn't multitask, since its only really supposed to be used
for changing not-so-often-changed system varibles.

I picked up rz.prg and sz.prg, they don't seem to support all of the standard
zmodem commandline options (download to a path, recover from crash) etc,
they do multitask nicely. I get the normal 230-240 cps and I can do other stuff
(shell, edit a file with edhak) with no loss of characters and what not..
on my stock 8mhz STe.
They also don't run in a window, so they dirty the desktop with 'bytes
received: xxxx'

sigh I guess we can't have it all yet...

As another plug for Me (Dark Oak software), I got a zmodem transfer 'skeleton'
right now working, no windows etc, but it *is* compiled with mintlib.

When I get it working right, i'll let you all know.

>on a postscript printer?

If you only want laser printer quality, then you don't need PostScript. Cubase comes with an SLM804 laser printer driver. Hopefully, it also comes with a LaserJet driver, although I do not have my ST at hand to check.

PostScript is obviously useful if you want to print at better-than-laser quality, but the current ST version of Cubase has no such driver. The Mac version does have a driver that can produce PostScript or Encapsulated PostScript, the latter being very useful for finishing your manuscript with a real dtp package.

Cubase is soon to be replaced by Cubase Score, apparently, which has more sophisticated scoring facilities. Maybe it will have a PS driver? Try contacting the UK distributors, Harman Audio. I do not have their number to hand, but try Directory Enquiries; Harman Audio are in Slough.

As far as I know, this CD-ROM has to be initialized to 2048-bytes/block mode.
Color Concept (makers of the Photo CD software) are shipping an auto folder
program for that.

Does anyone out there have or has heard of Disk Drives Limited of Kent?

I recently had a major upgrade with my Atari STe by buying lots of new and second hand stuff.

One of the second hand ones was a 48Mb Hard Disk Drive.

Now, I did get a manual with it, and it has a technical helpline phone number, but it seems that the company has gone bust. I made loads of phone calls to Atari UK, Atari Workshop, Silica Systems and other major Atari dealers here in the UK, but none of them had heard of the aforementioned company.

I have opened the caseing to the drive, and found that the SCSI interface is by the same company. My problem seems to be that I don't know how to change the battery in the in-built clock, as I can not see where the existing one is. I really need to change the Battery.

Also, I'd like to increase the size of my HD by adding on another bare drive. How do I go about it?

Please help.

*** GSZRZ.PRG/ACC ***

Well if you buy the Latests SZ/RZ.PRG you will get it all, there is no piont in
reinventing the weel, is there, but his latest version 3.4 is no longer PD,
but 30DM, it can allso be called as a ACC, and from what the author
Michael Ziegler has told me its compatible under Mint/MutiTos, and from the
Docs it looks like its been that way for nearly a year...

Also has support for the ARCV that the others don't have, a must for batch
uploads...

Worth buying...

Xairete, Barbaroi!

That would look a lot better if I could manage the proper alphabet. Am I the only Atari-using Classicist in the world? I've been staggering along with a Greek font cobbled together from the International character set and creative keyboard mapping on Word Perfect 4.1--that and my SMM-804 printer (screen shot available on request). There's GOT to be a better way.

Word Perfect having dropped us, I'm getting ready to drop them, but would definitely need the footnotes, outline generator, Table of Contents generator and the Thesaurus from Hell. Redacteur, hommes Francaise? That's Write II, mates? Ist eine alles? And above all, I want to do (have to do!) GREEK!

>>remeber it's name) will work.

>Sozobon and Pure C are also supported.

Sozobon? To compile MiNT itself? Nothing in the 1.04 source
distribution indicates that. Now that it's summer and I have some of
my free time back, though, I plan to rectify that ;).

The MiNT _libraries_ are, of course, available for Sozobon C and HSC
(yeah, yeah, I'm most of the way through building pl30, so it'll be out
soon).

>BTW: Is it possible to compile the MiNT Libraries under plain TOS?

The libraries themselves? Sure. All you're doing, after all, is making
object code and libraries; you shouldn't need MiNT features for that.

THAT IS NOT EVEN A LITTLE TRUE. Lattice C is a C compiler and only
a C compiler.

I hadn't heard that and had heard to to the exact contrary.

In any event, Comeau C++ 3.0 With Templates is literally based upon
the AT&T USL cfront 3.0 compiler, and can assure you that not only is
it not unreliable but that it is among the top compilers in stability
and robustness and adherence to the spec. We're doing an Atari port
of Comeau C++ right now just to prove that ;-) (Seriously).

7653. Falcon sighted and purchased!

Newsgroup: comp.sys.atari.st
Date: 1993-05-28 15:36:58 UTC
From: apalmer@pyrtech.mis.pyramid.com
Message-ID: <1u5biq$d49@pyrtech.mis.pyramid.com>
Source record: 205350

I purchased my Falcon yesterday from B&C ComputerVisions. I was #1 on their waiting list for the Falcon. I did not have to pre-pay to be on the list. Atari split the Falcons between the dealers. I was told each dealer was able to get three.

These units have a newer rom rev and a 84meg drive. (not 65meg) The story is that Atari ran out of 65meg drives and had to install 84's. That was OK with me.

What do you think a README file is for ... it states it states that youneed at
least a SVGA-monitor.
And by the way none of the Resolution-Enhancements (ScreenWonder,
ScreenBlaste or BlowUP030) for the F030 brings you lot of increasement on a
non-SVGA or non-MultiScan

Toad Computers, 1-800-448-TOAD. Check out a Beetle Mouse, they are cool
(if you have small hands). For large-fisted folk, the stock ST mouse is
probably better.

7656. Falcon Bought in USA

Newsgroup: comp.sys.atari.st
Date: 1993-05-28 17:56:11 UTC
From: foster@rufus.nsc.com
Message-ID: <1993May28.175611.17796@berlioz.nsc.com>
Source record: 205342

I purchased a Falcon from B&C Computers yesterday also,
I think I was first on the waiting list ;) Albert... ANYWAY.

Here are some impressions.
I really liked Atari Works and SpeedoGDOS. They worked fine in 16 color mode.

I am fortunate enough to have an ACER multi-sync so I can run the computer in
all graphics combinations. I liked 80 column 256 colors the best. Looks rock
solid.

The TrueColor mode was excellent and had almost no flicker when displaying
stills. B&C put alot of .TGA files on the disk for me.

Some of the demo's were awesome. Terifim (sp?) and CEBIT93. Excellent graphics
and sound simulatneously.

I had some hellatious crashes though. MultiTos caught a lot of them. One problem
I had was that MultiTos was not last in my auto folder... I found that this
was important from the manual and it helped things very much.

Well I don't want to bore you.

05/27 1506 ATARI CORPORATION POSTS LOSS OF $2 MILLION FOR ...

SUNNYVALE, CA (MAY 27) PR NEWSWIRE - Atari Corp. (AMEX: ATC) today reported its operations for the first quarter ended March 31, 1993.
Sales for the quarter were $10.1 million versus $44.1 for the same period in 1992. Anticipating the decline in sales, the company instituted additional restructuring programs in the fourth quarter of 1992 and reduced its overhead in the first quarter of 1993 to $5.9 million, as compared to $16.1 million in the first quarter of 1992. As a result of the lower sales offset by the lower overhead the company incurred a net loss for 1993 of $2 million, as compared to a net loss of $13.8 million in 1992. In addition, the company incurred a loss on exchange of $12.1 million in 1992, versus a gain of $0.7 million in 1993.
Commenting on the report, Sam Tramiel, president of Atari, said, "The company has commenced shipments in small quantities of its new Atari Falcon030(TM) computers, and initial reactions have been favorable. We expect production of the Falcon030 to increase during the second quarter. In addition, the company has released for production its proprietary chip set for its new multi-media entertainment system called 'Jaguar.' We are currently organizing the launch of this product. The company has available over $40 million in cash to fund the introduction of these new products."
Atari Corp. manufactures and markets personal computers and video games for the home, office and educational marketplaces throughout the world. Atari headquarters is located at 1196 Borregas Ave., Sunnyvale, CA 94089.

P.S. Any ideas on why the blitter wants 32623 bytes on medium res?
It crashes is you give it 32768 bytes - the 14 hour mistery.
Also, a desk accesory can be closed and opened and GEM gives
good information on screen redraws for the window. But if
that accesory opens a fileselector box, GEM updates the
accesory
first and then the window. Poof, accessory vanishes from
screen.
I'll call this the 157 lined mystery.

Actually, I've got large hands and I LOVE the Beetle Mouse. After my Atari mouse died and then my Best mouse died, I got the Beetle Mouse and it's the best so far. What I find is that the whole mouse fits in my fingers and the palm of my hand is pretty much resting on the mouse pad. This way it feels more like a finger device than a palm one -- more control that way perhaps.

So, maybe if you have either small or big hands it works, but not medium ones... :-)

GEMView is great for JPEG pictures, although it doesn't do any fancy screen stuff so if you only have 16 color modes the pics may look pretty bad. On a TT or a Falcon it's great though (although I still think it could be sped up somehow... :). Nice thing about GEMView is it has a ton of other formats too.

I think it is plain to see that the Falcon030 is going to be sold in
the 1040 ST style case we see.

If Atari puts anything in a PC-style or tower case, it is going to be
faster than 16 MHz!

But, I don't think we will see any new Falcon computers until early 1994.
This is my prediction.

Atari is too busy manufacturing Lynx, Jaguar, and Falcon030 to start
manufacturing more Falcons.

7676. SNES programming on ST

Newsgroup: comp.sys.atari.st
Date: 1993-05-29 06:21:48 UTC
From: phruby@ucrengr
Message-ID: <31919@galaxy.ucr.edu>
Source record: 205211

I found this assembler for the ST that lets one assemble SNES games.
Does anyone know about this assember? Are SNES games developed on the ST?
(ya, right!) sorry, evil twin. Does anyone know of an FTP site with technical
programming info on the SNES so I can put this assembler to use?

Paul
phruby@ucrengr.ucr.edu

p.s. I know the address is wrong! I like it that way. This way I have
the choice of receiving e-mail or not. :-> Evil twin again.

7677. ls-lR.Z File on A.A..

**** HELP... ****

I am trying to get the ls-lR.Z file from A.A. by the mail-server,
nothing seems to work..??

Can some one give me the correct procedure...

Thanks...........

Roger.............. sheppard_r@kosmos.wcc.govt.nz

Anyone any success with compiling MiNTlib with Lattice 5.52? Mine makes (ok, projects) OK, but you need to add crt0.s and then the stuff crashes if you compile a file using it. Do you have to compile the lib INTO the existing LCNB.LIB? And can you compile it into base-relative?

David.

NB: cross-posted. Follow-up to .tech!

>Warwick Allison was working on a GEM-based graphical NetHack (get out
>those TTs and Falcons so you'll have a useful screen size at 16
>colours!), I was going to add sound support if I had time...

Sound support? Great!!
About the screen size thing though, has anyone tried playing 640x400 using MonSTEr? I was wondering if this would work...(ya know, 16 colours AND a useable screen interface...)
Don't have a Falcon or TT just now, so using MonSTEr would be a BIG plus!!

Vaya con Dios,
AcEzE.
Got my sig back!!!

7683. STReport _VERY_ inaccurate

Newsgroup: comp.sys.atari.st
Date: 1993-05-29 15:27:10 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1u7vce$lal@usenet.INS.CWRU.Edu>
Source record: 205218

Well, STReport has been released again with Atari's stock reported
at .81 cents.

Atari's stock has been above $1.00 all week. In fact, above $1.25 all week.

On Friday, May 28th, Atari's stock closed at $1.75.

I think everyone should remember this when they read ST Report. If the
publisher cannot report Atari's stock right, how should readers expect to
believe the news he reports???

And it is just my personal opinion, but isn't the QUOTES in the beginning
of the magazine getting _REALLY_ out of control???

Len

Dear Colin!

You should try GemView 2.1, available from ftp.uni-muenster.de or
ftp.informatik.uni-stuttgart.de. (Gemvie21.* or something like that,
subdirectory /pub/atari/graphics. I hope so :-)

It works with following graphic-formats:
"GEM-View images [*.GVW]" (internes Format)
"TIFF Format [*.TIF]"
"GIF Images 87/89 [*.GIF]"
=>> "JPEG Images [*.JPG]"
"Sun Rasterfiles [*.SUN]"
"Imagelab Images [*.B&W]
"STAD Images [*.PAC]"
"IFF Imagefiles [*.IFF]"
"HAM Hold & Modify [*.IFF]"
"MS-Windows Bitmap (*.BMP, *.RLE)"
"OS/2 Bitmap (*.BMP)"
"GEM-(X)Image Files (*.IMG)"
"GEM-Metafiles (Vector) (*.GEM)"
"Neochrome Rasterfiles (*.NEO)"
"Art-Director Rasterfiles (*.ART)"
"Degas Images (*.P[IC][123])"
"Tiny-Compressed Images (*.TN[123Y])"
"Doodle Monochrome Rasters (*.DOO [640x...])"
"Spectrum 512 Images (*.SPU, *.SPC)"
"Portable Bit Map [*.P[BGP]M]"
"MacPaint Image [*.MAC]"
"PC Paintbrush (monochrom) (*.PCX)"
"X Bitmap-File [*.XBM]"
"1st Word Files [*.DOC]"
"Load as Text or Hexdump [*.*]"

Greetings,
Christian

I some excellent US and German shareware that I want to register. What ios the best way of getting currency to the authors?

Previously I have stuffed dollar bills left over from holidays into envelopes (it worked!) Obviously, this is not very safe and not feasible for those currencies that I do not possess (I want to avoid high bank commission rates)

Neither of the authors can handle credit card payments, so what's the best way (i.e. cheapest and most secure) for me to get money from the UK to individuals in the USA and Germany?

: (You could also just buy pre-packaged HD units, but
: they ususally aren't a very good deal...) If you go with the Link, which makes
: for a much more astheticly pleasing setup, just get any Mac/PC/Amiga (!)
: external SCSI Hard Drive unit and plug it in.

There are another option. You can purchase an empty hard disk case (with
power supply), one of those the manufacturers of external SCSI drives use to
manufacture external SCSI drives :-) seriously though, they are hard to find,
but you can buy them separately. Price would be $100 or so, I guess.

You can then proceed to mount a hard drive (choose a big one, at least 200 MB,
smaller ones are just not worth getting given the price/size relation) an
an ICD mini-SCSI host adaptor inside. You will have to think about what do to
with the external 50-pin amphenol connector (ACSI uses 19 pin sub-d), but
you can solve that problem: Either remove the amphenol, or custom-make a
cable to connect your Atari (19 pins) with the hard drive case (50 pin).

$10 million in sales, thats pathetic. It shows what imcompetent management Atari has. Atari has to learn to get products out on time. They should look At Apple as an example. Look for another new round of mac product introductions on June 7. Of cource Apple will spend more than $10 million to back them up...

Hi. In an attempt to free space in my computer room, I am attempting to unload my old Atari magazines. I have every issue of STart (maybe missing one or two), Antic from 84/85 to its demise, and Current Notes from 85-88. I have not set prices in mind, so anyone who is seriously interested make me a reasonable offer.

I also have some Abacus books and games I am willing to part with . . .

10 million dollars in 3 months? Well suppose every computer would have cost $500 (for dealers) they have sold 20000 machines. That's more than I would have expected.

For a company that doesn't sell anything but a few Falcons and TTs - and perhaps some 1040STEs, that's a good number. For ATARI that once sold 100000's of machines a year that's a bad joke.

I really hope ATARI gets bankrupt - together with the Tramiels - so someone else can buy the right to produce these fantastic machines like the Falcon and the Lynx.

Why do you want to replace WWST? I have yet to see its replacement!
It is the fastest, easiest, WYSIWYG word processor. Truely one of the
greatest ST programs ever devised!
I use Calamus for DTP, and have played with the SCRIPT III Demo
(bitchen program, auch!). I think if there was a little bit quicker
version of SCRIPT III, your problem would be solved...but at DM199, it's
a bit out of my range (especially since I am thinking about selling my
ST stuff).
Script III is definately worth the ftp time! (I am thinking of
translating the RSC file, however, as my Deutsch ist nicht so gut.)
Anyone know if there is a copy available in english? (or American ;)

Until then, WWST is my mainstay.

Of course, you neglected to specify which TOS version you are referring to.
TOS 1.0x is incompatible with anything but a 68000, unless you want to add
patches as you suggest.

Then, there's TOS 2.0x, 3.0x, and 4.0x which work magnificently on 68030s.

My father's got an Atari ST and would like to get connected
to the Internet. He's living in South West Germany and I was wondering
whether anybody from that region got access to a local BBS and could
tell me

o what costs he can expect (monthly fees, buying a modem etc.)
o what software is recommended, any public domain available ?
o a contact address

I think e-mail would be the service he'd need most, followed
by ftp and news.

Any help would be appreciated.

Please e-mail and I'll post a summary.

Thanks,
patsch

On the sequencer issue...
I have been let down by many sequencers because the learning curves and the
lack of intuitive controls usually inhibit the creative process to the point
where it's not worth bothering with sequencing. I'm not saying I'm not
competent - I'm a software engineer (hmmm... maybe I am incompetent... 8^o),
but sometimes I wonder how people in non-technical professions can get by with
some of these high-end products with the infinite learning curves. Anyway,
I was all but through with sequencers forever when I happened upon the demo for
The Final Cut v3.0 from Legend Software. I gave it a shot since it was nearly
free to test-drive (I got it from GEnie, but it's probably in atari.archive
also). To make this long story shorter, my recording life will never be the
same. I immediately ordered the real thing (I think it goes for $89), and I
can't say enough good things about this wonderful program. Plug, plug, plug...

I have no relationship at all with this company, other than the couple of times
we talked on the phone about the program features. And you've never seen me
plug any product on the net ever before, but I _really_ think this program
deserves recognition. Bruce Johnson, the programmer, told me that there's
been some sort of falling out with MIDI Land Inc., the company that was
supposed to be marketing The Final Cut in the U.S., so their chances of getting
the exposure they deserve aren't very good. But you can still buy direct from
Legend Software in Canada, at the following address: (call for present pricing)

Legend Software Systems
3508 34A Avenue

Edmonton, Alberta
CANADA T6L 5E8

Tel: (403) 450-0736

Incidentally, there is also an IBM-compatible version available with the same features.

This just goes to show that the big guys don't always have the best value for the buck. I have nothing against programs like Cubase - I know there are die-hard fans out there just waiting to flame me - but sometimes there are great alternatives for a fraction of the price. For me, The Final Cut has all the features I desire (and more), and I didn't have to go through tutorials to learn how to control it. It's very seldom that I have to refer to the manual for anything, and usually it's just to look at the page that references the 'Hot-keys' to refresh my aging memory. At least check the demo version out. (And check out the Cubase demo, too. That way, you can see how each would perform for your application, and you have something to guage each one against).

- Jeff Andrews

P.S. - on the Sample-editing topic... I use Avalon (Steinberg), and even though it (like Cubase) is also very pricey, it seems to be the most powerful program of its kind. Any low-budget powerhouse contenders out there that I haven't run into yet?

>
Paul,

Just a note of caution. Some Seagate HD's are infamous for not being
able to "spin-up" when they get old. I'm not knocking them - I have 2 Seagates,
as well as a Fujitsu and a Syquest. The only one I've ever had real trouble
with was the Seagate ST296N which wasn't spinning-up well for a while. It
seems to have recovered on its own... knock on wood... My brother has a 40Meg
Seagate that never spins-up on its own. He says he has it accessible so that
he can start it spinning with his finger. Whatever works, I guess.
However, since you mentioned that the fan is also taking excessive time to
start, your power supply theory may well be correct. I just wanted you to know
about the tendency of some Seagates to lose their ability to spin-up properly.

Good Luck,

Jeff Andrews

Andre,

I'm not sure there is a U.S. representative for DMC, as such. I have always dealt with DMC direct in Canada. I looked in their latest flyer, but I can't find a program called TYPE ART. I have Outline Art, and now there's a new version - Outline Art 3, and there's also The Calamus Font Editor. Maybe one of these is what you're referring to? If not, I'm sure Nathan Potechin (the president of DMC Publishing) will know what you're after. His address on GEnie (unless it's changed recently) is ISD. And, to his credit, he responds to all GEnie-mail inquiries within 24 hours unless he's on a business trip.

Alternately, the address for DMC in Canada is:

DMC Publishing Inc.
2800 John Street, Suite 10
Markham, Ontario
CANADA L3R 0E2

Tel: (416) 479-1880
Fax: (416) 479-1882

P.S.- How does one "fish" a program? (See above) ...sounds fishy alright...

- Jeff Andrews

From: rosenkra@convex.com
Message-ID: <1993May30.165034.5854@convex.com>
Source record: 205245

can someone send me or point me to a reference for .GL and .DL file formats?
these are animations. i know there are X viewers for .GL files but i can't
seem to find one in the comp.sources.x index. i don't recall seeing anything
in dave bagget's image format thingie. i don't particularly need a viewer,
just the file formats. i'd like to add this feature to MGIF eventually.
incidently, johan klockar's mgif 4.1 fixes my original errors in convolutions
so they work correctly now.

thanx

I am selling the following:

1. 1040st with mono $160

2. Hybrid arts smpte track $175
Works great with smpte in/out
also has other sync in/outs

3. Megamax C compiler $50
Devpac st 68000 assembler $40
EZ-score by hybrid arts $25
All my 1 sided disks $20

I'm bailing out to a new 486/66.
Maybe if I had a hard disk, oh well.

I've decided to move up to color, so I need to sell the following:

HP DeskJet Plus... About two years old, works great. Includes Times Roman
font cartridge, original box and manual. Includes almost-new ink cartridge,
and an empty high capacity ink cartridge (for refilling). Must sell ASAP.
$225 plus shipping FIRM.

Panasonic KX-P1124 24-pin dot matrix printer. Six built-in fonts, three-way
paper handling. Works great, about three years old -- used it before I got
the DJ, and it's been in the closet since. Includes two ribbons.
$150 plus shipping.

Please send Email if interested.

**********For Sale**********

Since I have been getting offers to split various components, here is a listing of asking prices for the components

ATARI MEGA ST2.....$325/obo
Atari Mouse, Keyboard

Color Monitor (SC1224).....$150/obo

ICD 48meg hard drive (Seagate, dual HD case)...$275/obo
Various Utilities on drive(graphics, sound, etc.)

All Original Boxes

Software includes:
Word Writer ST / Swiftcalc.....$15
Timeworks Publisher ST.....SOLD
GFA Basic/Compiler 3.5.....$50
MasterCAD.....SOLD
Tiger Cub.....SOLD
MIDI Recording Studio.....SOLD
GFA Raytrace.....$15

if you buy 4 or more of the above, I will subtract 25% from the price
$90 will take all of the above

GAMES:Currently, all of these are SOLD
These three are in one game pack.....$15
Blood Money
Rocket Ranger
Speedball

Shadow of the Beast.....$5
Falcon (1.0 and 1.2, mission disk 1)..$20
Alien Syndrome.....$10

$35 for all the games
I would prefer a minimum of 3 software titles per person to make shipping easier

Asking $700 or best offer for all that is left
Buyer pays shipping

Email me at fymah@essex.ecn.uoknor.edu

7716. ST Games Forsale!

Newsgroup: comp.sys.atari.st
Date: 1993-05-31 05:41:57 UTC
From: beave@hardy.u.washington.edu
Message-ID: <1uc5r5INNd01@news.u.washington.edu>
Source record: 205056

In order to clear some space in my disk case and make a few bucks to boot I am selling the following games. All games come with original documentation unless marked with an (*).

Phantasie III The Wrath of Nikademus
Puffy's Saga
Tau Ceti The Lost Star Colony
Space Quest III
Weird Dreams
Zany Golf
Black Cauldron
Powerdrome
Willow
TotalECLIPSE
Plutos
Hostage Rescue Mission
The King of Chicago
Into the Eagle's Nest
RoadRaider
Alternate Reality The City
Gauntlet II
Moebius The Orb of Celestial Harmony
Menace
Obliterator *

For the gamer out there who thrives on playing the classic games listed above I will make a sweet deal. Take all twenty for $75.00, that's $3.75 a piece. You can't beat that in the discount stores. Plus shipping and handling of no more than $2.50. Otherwise I will sell bit by bit at $5.00 a piece including shipping to anywhere in the continental U.S. Buy more than three and pay only $4.00 a piece with shipping as above. Make me an offer if even the above prices don't suit you. BTW, I also have a Goldstar 1200 buad external modem that is collecting dust since I upgraded to 14,400, $15.00 or best offer.

Hoping to here from you soon by E-mail,

The standard is not VGA, is Super VGA and it changed a while ago!
A typical PC nowaday's will show you 256 colors but by far more faster
than a Falcon (or an Amiga... >sic!<) for that matter.

Now, 24-bit graphics card are getting more and more standard....

I guess you are right, but on the other hand you can get a faster CPU
by just paying $500 more on a PC with a bigger hardisk ($1,800).

For sound the Falcon looks nice, but seems that 'thats about it.

I guess this says something about the market of the Amiga 1200 vs
The ATARI Falcon... Hmmm....

(to those that stomp on the Amiga every single time without
getting some facts, and to those that don't some consolation:
Commodore might be in the same position as Atari if they
don't improve more their line/release new products!)

Actually, I think it depends. While having a standard graphics card built - in there cannot be swapped quickly, the advantage is that all software written for a machine X can assume that as the lowest standard, so overall software performance, quality, etc. (assuming the buil-in graphics are good) tends to be very very good.

This is why when I look at multimedia in the PC area, it still seems to suck big time. Now, something like NeXTSTEP OS might change that if their 'NeXTTIME' is as good as I hear, but that won't take place 'till quite a while (1 more year or more).

And let not forget about those nasty jumper/card configurations on a lot of clones where card X might not work properly with Card Y...

NO NO NO, This is were the ICD LINK comes into play,,its a host adaptor inside
a small dongle like thing, with a 19 pin ACSI at one end and a 50 way Amphenol
at the other...

A very simple way to get ASCI to SCSI don't you think..??

From what I have read the ICD Micro Host adaptor is no longer made...

COMPUGRAPHIC FONTS...

There seem some confusion on the adverts for Pagestream, well to me there is.

The UK version of Pagestream, they are stating that it comes with
10 Compugraphic Fonts, but the US version only has 3.

Also I have the review of Pagestream, (ST-Informer) it stated that Soft-logik
with not be providing any more Compugraphic fonts..

Any idea's on this one...??

7727. MasterBrowse 2.5 (uploaded to a.a) (short)

Newsgroup: comp.sys.atari.st
Date: 1993-05-31 07:03:26 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.gyM9DnaSfIl@elfhaven.ersys.edmonton.ab.ca>
Source record: 205241

This is just a short note to let people know that there is a new version
of MasterBrowse, with some important changes.

* The most important change is that MasterBrowse now has a transparent
interface to the popular MegaDepack decompression program, so that it
can handle any of seventeen different compressed file types. This is
really great for saving space!

* MasterBrowse will also now allow spaces inside the printer identification
string.

The new version of MasterBrowse (2.5) has _not_ been sent to
comp.binaries.atari.st (there have been three versions submitted there
already - it might not be a good idea to push my luck).

It _has_ been sent to atari.archive.umich.edu and should have a
a filename of mb25_bin.zoo or MB25_BIN.ZOO.

>lowest standard, so overall software performance, quality, etc.
>(assuming the buil-in graphics are good) tends to be very very good.
>

If all software assumes the lowest standard, then the ST and Amiga platforms would be dead in the water, graphically.

Most users would still be using sub-SVGA graphics, which, in terms of units sold, would still be tiny, miniscule, drops of water in the oceans of computers out there. :)

The best Amiga s/w would assume a text mode of 640x200 non-interlaced for DTP work.

The best ST s/w would force the user to go 640x400 mono.

The PCer would plop in an SVGA card and run happily away.

The beauty of the ST (and the Amiga, or so the Amiga owners who don't rant about the beauty of the copper list :) claim) is device independence. If you write your program write, it doesn't matter what the video card can do, your software works and, even more, takes advantages of any new features (i.e., more bitplanes, etc...).

Since TOS/GEM can do this... the only problem facing Atari is making the machines expandable. The Falcon's sure aren't expandable in a standard plug 'n play, slap a card in and dance, way. But then, neither is the A1200. But the clones in a comparable price range ARE.

7729. Floppy-Friendly ESS UUEncode/UUDecode at a.a

Newsgroup: comp.sys.atari.st
Date: 1993-05-31 08:11:32 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.dnoRG4&mhF2@elfhaven.ersys.edmonton.ab.ca>
Source record: 205067

This is just a note to let those who are interested know that a new version of ESS UUEncode & ESS UUDecode has been sent to atari.archive and the filename should be ess_uux.zoo or ESS_UUX.ZOO when it is processed.

The main difference is that the new version of ESS UUDecode is more friendly with floppy systems. You just run the program, click on the "Select Source & Target" button, and away you go. You no longer have to install it as an application.

Also, ESS UUEncode has been cleaned up a little in terms of its usage display.

I made the new version after a few people complained about the lack of floppy support. Hopefully, this version will serve them better than the last one did.

Message-ID: <PT91JS.93May31110937@phoebe.pt.hk-r.se>
Source record: 205073

I recently installed a math co-processor in my Mega STE. However, when
I tried to assemble a little routine with the math co-processor option on,
the assembler answered that there was no math processor. I examined the
_FPU cookie and there is 0.

Do I have to run any program or something to initiate the math processor, or do I have to change a dip switch, or something else?

Please mail responses to: pt91js@pt.hk-r.se

Message-ID: <1ud0ut$2tk@tricky.wft.stack.urc.tue.nl>
Source record: 205071

Hello,

I like the atari computers and I also like playing with lots of
different software. The problem I'm facing now is a lack of diskspace.
So I want to make a CD-ROM with al kind of atari-software, such as:
ST, TT, Falcon etc...

I can not make only one CD, because this would cost me too much.
If someone else wants to have such a CD as described above, let me know so
I can cut the costs to < $100,-.

PS: If you want some special kind of software on this CD tell me, because
600 Mb is hard to fill up (No illegal software).

Please reply by mail.

Jim.

7733. Motorola chip speeds...

Newsgroup: comp.sys.atari.st
Date: 1993-05-31 14:00:43 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1ud32b$9i@usenet.INS.CWRU.Edu>
Source record: 205069

I was just wondering how fast the different Motorola chips can go.

The Motorola 68000 can have the speed of 8 MHz(ST) or 16 MHz (Mega STe).

Then there is the Motorola 68030 which can have the speed of 16 MHz (Falcon)
or 32 MHz (TT).

There is also the speed of 40 MHz on the Motorola 68040, is that correct?

Are there any other speeds? Such as 50 MHz?

I'm assuming that all chips going 32 MHz+ needs fast ram.

Hello !
I know that this is a FAQ but ,...
I am an owner of an ATARI ST computer.
I'd like to use some programs I can transfer by FTP , but the only
terminal I may work is IBM PC !
Is it possible to copy programs for ST from PC disks and where I can find
such a program. I mean program that copies not only ASCII files
especially *.prg

Thank you in advance !
KORMO

7735. Other questions (Falcon030 & memory)

Newsgroup: comp.sys.atari.st
Date: 1993-05-31 16:02:40 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1uda70$cmc@usenet.INS.CWRU.Edu>
Source record: 205070

I have a few other questions relating to the Falcon030 and memory.

The Falcon030 (16 MHz) computer uses regular RAM.

What happens when fast RAM is used in future Falcon computers?
Will there be compatibility problems?

Thanks.

You'll have compatibility problems to the degree that the programs running
in TT RAM have compatibility problems -- therefore, only minimal. I can't
think of a program that I use that I don't have running in TT RAM. It's
really not a problem if you do productivity stuff.

7737. BIG package, SMALL price ***FOR SALE***

Newsgroup: comp.sys.atari.st
Date: 1993-05-31 19:25:00 UTC
From: v115lue3@ubvmsb.cc.buffalo.edu
Message-ID: <C7wolv.3rL@acsu.buffalo.edu>
Source record: 205074
Cross-posted to: comp.sys.atari.st,rec.music.synth,comp.sys.music,comp.sys.forsale

I'm selling all of my ST equipment for the price listed at the bottom of this message. I've grduated from school, and due to work I've had to get an MS-Dos notebook instead (for what it's worth, I prefer the ST - more intuitive and fun to use...sigh). I am only interested in selling everything as a package, primarily because I do not have the time to start splitting everything up. On the off chance that you want a specific item, my price is listed w/ each. I will only consider changing the price for someone who is interested in buying the whole package. Here goes:

*** Mega ST2 $600 (includes all upgrades listed)
- nice design, comfortable external keyboard, has room on the motherboard to easily be upgraded to 4 meg

- MIDI ports

- TWEETY board installed (splits the ST's sound output into 2 channels to be played through your stereo)

- SWITCHABLE TOS 1.2/2.06 (the newest TOS, I installed the switch myself; it allows you to have complete compatability with any software by choosing the operating system it's most compatible with. 2.06 is extremely fast and has TONS of features - nicer to use than macs or windows IMHO)

- all the usual ports- parallel, serial, hard drive, 2nd floppy, monitor, etc.

- golden image mouse

- extra atari mouse

- Warp 9 registered & installed

**20 meg hard drive $200

**SC1224 Color Monitor $200
- will accept either 60 or 50 Megahertz sinc

**SM124 Mono Monitor $125
- internally adjusted for maximum screen size

**2400 baud modem & software $50

**external DS/DD floppy $50

**Epson LQ-850 high speed 24 pin printer $200 (needs ribbon)

**Navarone Video Digitizer $40

**Monitor Master $40

**Mouse Master $30

**software: $600
|
- I have a ton of stuff, almost everything you could ever need/want
word processing, telecomm, dtp, programming, graphics, music, a *TON*
of games.

I have *** 335 *** disks of software. Plus an additional 40 or so
blanks.

All appropriate cables, power supplies, and manuals are
included. All of the equipment is in extremely good condition.
Everything is clean and has been VERY well kept.

- I also have some of the boxes for the hardware (computer & 1
monitor I think.

****
Total cost = $2,135
****
******
I will sell it all for $1,000 <---- (that's a good deal)
******

plus shipping (or will deliver within 1 hour driving time of Buffalo, NY)

If you are interested in what I've got, E-mail me at this account. I log
in daily..

7738. Cubase Lite vs. Cubase (for Atari ST)

Newsgroup: comp.sys.atari.st
Date: 1993-05-31 19:38:35 UTC
From: cmedley@wam.umd.edu
Message-ID: <1udmrr$7k@cville-srv.wam.umd.edu>
Source record: 205075
Cross-posted to: comp.sys.atari.st,comp.music,rec.music.makers.synth

Could someone explain to me the functional differences between Cubase and Cubase Lite for the Atari ST?

I'm using a Mega ST 4 @ 16mhz 68000 with a monchrome monitor and a 105MB HD.

I have no need for notation capabilities (can't read sheet music) but I do want powerful graphic editing features of what i play in. I don't usually poke around note-by-note in a sequence. I do like to make changes over "ranges", i guess you could say.

I've been using Dr. T's KCS OMEGA, but I'm still a little disappointed at how the song editor is not integrated in to the rest of the package, and the track recording method is somewhat limiting. The Open Mode recording seems to harken back to the C64 roots of the program.. so I am looking for something more GEM-based.

Will Cubase or Cubase Lite fit the bill? Also, what will be Steinberg's policy for those who upgrade to Atari Falcon 030's who want Cubase Audio later on?

Date: 1993-05-31 20:46:08 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1udqqg$i97@charm.magnus.acs.ohio-state.edu>
Source record: 205078

Well, it is the end of classes and I started to really delve into my midi software. I have run into an impass with EZ track+ (1986) by hybrid arts. I didn't get any docs with it, but have been muddling with it and learnibg from my mistakes. I have gotten everything to work except the glue segment command in the track menu. What I am trying to do is set up a loop of 10 measures, so that I can just try out some melodies without restarting every time the measures run out. I can take a single measure and store them to a track, but cannot take a single measure and copy it 40, 50 times to itself.
I believe that the function has something to do with the track timers, right above the start/stop/forward&rewind buttons. But all I have been able to do is erase portions of the track I previously edited.
I am also interested if there is a way to have one track start after another finishes, this is probably what I am looking for.
Any help with this would be appreciated. I am also looking for the manual for this. So if you have a dusty copy that you don't use, I will pay any reasonable price. Thanks...

Michael Steve jr.

So, in other words, you don't need ST RAM in your TT for most of your software?

That's good news. How about games? Do you think all of the Falcon030
games will be able to run on a TT030 using fastram?
